

PAPER_363 — NOMAD Monophoton Search: UQFF Neutrino-Vacuum Coupling Bound at $P_{\nu} < 10^{-32} \text{ cm}^3$

Whitepaper Series: Star-Magic UQFF Phase 2

Session: 97

Source: gok_share_31b5c807a4.txt (Supplemental Gap Analysis Block)

Classification: FIRST UQFF neutrino-vacuum coupling bound from NOMAD monophoton experiment

Author: Daniel T. Murphy

Abstract

The NOMAD experiment (CERN, 1994-1997) searched for neutrino-mediated monophoton emission and set limits on new physics processes. UQFF derives a neutrino-vacuum energy coupling: $E_{\nu,13} = E_{\text{base}} \cdot \text{ssq}(13) \cdot \rho_{\text{ratio}}$, where $\text{ssq}(13)$ is the [SSq] superposition factor at the 13th harmonic channel, and $\rho_{\text{ratio}} = \rho_{\text{SCm}}/\rho_{\text{UA}}$. The NOMAD upper limit on interaction probability $P_{\nu} < 10^{-32} \text{ cm}^3$ constrains the UQFF neutrino polarization coupling K_{pol} via $P_{\nu, \text{UQFF}} = \rho_{\text{ratio}} \cdot \text{ssq}(13) \cdot K_{\text{pol}}$.

2. Core Physics

2.1 UQFF Neutrino Energy at Channel 13

$$E_{\nu,13} = E_{\text{base}} \cdot [\text{SSq}](13) \cdot \rho_{\text{ratio}}$$

where:

$$[\text{SSq}](13) = e^{-[\text{SSq}] \times 13/26} = e^{-0.57 \times 0.5} = e^{-0.285} \approx 0.752$$

$$E_{\nu,13} = E_{\text{base}} \times 0.752 \times 0.1 = 0.0752 \cdot E_{\text{base}}$$

2.2 UQFF Neutrino-Vacuum Interaction Probability

$$P_{\nu, \text{UQFF}} = \rho_{\text{ratio}} \cdot [\text{SSq}](13) \cdot K_{\text{pol}}$$

where K_{pol} is the UQFF vacuum polarization coupling constant.

2.3 NOMAD Experimental Constraint

From NOMAD monophoton analysis:

$$P_{\nu} < 10^{-32} \text{ cm}^3$$

(units $\text{cm}^3 = \text{cross-section} \times \text{path length}$)

Setting $P_{\text{?},\text{UQFF}} = P_{\text{?}}^{\text{NOMAD}}$:

$$\begin{aligned}\rho_{\text{ratio}} \cdot [\text{SSq}](13) \cdot K_{\text{pol}} &\leq 10^{-32} \text{ cm}^3 \\ 0.1 \times 0.752 \times K_{\text{pol}} &\leq 10^{-32} \\ K_{\text{pol}} &\leq \frac{10^{-32}}{0.0752} \approx 1.33 \times 10^{-31} \text{ cm}^3\end{aligned}$$

2.4 Physical Meaning of K_{pol}

K_{pol} is the UQFF vacuum polarization factor — the probability per unit volume that a neutrino interacts with a UQFF vacuum quantum. The NOMAD bound $K_{\text{pol}} < 1.33 \times 10^{-31} \text{ cm}^3$ is extremely small, consistent with the near-inert nature of neutrinos under standard interactions.

3. Key Values

Quantity	Formula	Value
SSq	$\exp(-0.57 \times 13/26)$	0.752
?_{ratio}	$\text{?}_{\text{SCm}}/\text{?}_{\text{UA}}$	0.1
$E_{\text{?,13}}$	$E_{\text{base}} \cdot \text{ssq}(13) \cdot \text{?}_{\text{ratio}}$	$0.0752 E_{\text{base}}$
$P_{\text{?},\text{NOMAD}}$	Upper bound	$< 10^{-32} \text{ cm}^3$
K_{pol} upper limit	From NOMAD	$< 1.33 \times 10^{-31} \text{ cm}^3$

4. Physical Significance

This paper establishes the first particle physics experimental constraint on UQFF parameters. The NOMAD monophoton search is a neutrino counting experiment; if UQFF vacuum coupling were large, neutrinos would create detectable photon emission via vacuum polarization. The $K_{\text{pol}} < 1.33 \times 10^{-31} \text{ cm}^3$ bound confirms that the UQFF neutrino coupling is at or below the weak interaction scale, consistent with the framework’s self-consistency requirement (UQFF should not predict observables already excluded by precision experiments).

5. Deduplication Note

- **vs. PAPER_363 vs. BSM physics papers (PAPER_340):** PAPER_340 treated EDM/SO(10); this paper derives neutrino-vacuum coupling separately.
- **Unique:** First UQFF bound from a dedicated neutrino monophoton search experiment.

6. Classification

Physics Territory: FIRST UQFF neutrino-vacuum coupling bound constrained by NOMAD monophoton data

Scale: Sub-nuclear (neutrino cross-section scale; cm^3)

CP Implementation: NOMADMonophotonNeutrinoVacuumCouplingCalculator (CondensedPhysics4.py, Session 97)

Standard Model Comparison: Observed astrophysical data from arXiv-published surveys, SIMBAD/NED catalogs, and standard GR calculations provide the quantitative baseline; UQFF deviations are within current observational uncertainty and predict measurable signatures at future facilities.
