

PAPER_483 — Multi-System UQFF Compiler Modules: 4/5/7/8 AstroSystems Architecture

Abstract

This paper documents the **multi-system compiler modules** extracted from `grok_share_bdfb3a05b06.txt` — a new architectural tier above individual-system modules. Where PAPER_481 documents single-system UQFF implementations, these modules simultaneously compute $F_{U_{Bi_i}}$ for 4, 5, 7, and 8 astrophysical systems through a single `computeMasterEquations(system)` call, using a runtime-dispatched parameter lookup (`setSystemParams`). New physics includes the triadic simultaneous solver (`computeTriadicSolution`), gas-nebula integration (`computeGasNebulaIntegration`), and the Source160 computation validation showing $F_{U_{Bi_i}} \approx -8.32 \times 10^{217}$ N universally for template-mass systems.

3. New API Methods

3.1 computeMasterEquations(system) — Multi-System Dispatcher

```
cdouble AstroSystemsUQFFModule::computeMasterEquations(const std::string& system) {
    setSystemParams(system); // Populate variables["M"], variables["r"] for chosen sys
    return computeF(t_default); // Full F_U_Bi_i for that system's parameters
}
```

Supports runtime system switching:

```
AstroSystemsUQFFModule mod;
auto F_NGC685 = mod.computeMasterEquations("NGC685");
auto F_NGC3507 = mod.computeMasterEquations("NGC3507");
auto F_AT2024 = mod.computeMasterEquations("AT2024tvd");
```

3.2 computeGasNebulaIntegration(system) — NEW (UQFFNebulaTriadicModule only)

Unique to the nebular triadic module — computes additional gas-phase integration term:

$$F_{gas} = \int \rho_{gas}(r) \cdot g_{UQFF}(r, t) dV \approx \rho_{gas} \cdot g_{UQFF} \cdot V_{nebula}$$

This term accounts for the ISM/gas column density contribution to the UQFF total field in nebular environments, scaling with $L_{H\alpha}$ and SFR. Specific to NGC3596, NGC1961, NGC5335, NGC2014, and Carina Nebula — all star-forming or nebular gas systems.

3.3 computeResonanceUr(U_dp, U_r, system) — Resonance Mode Selector

```
cdouble AstroSystemsUQFFModule::computeResonanceUr(int U_dp, int U_r, const std::string& system)
// U_dp = DPM resonance mode (0=off, 1=on)
// U_r = resonant coupling mode (0=magnetic, 1=vacuum)
// system = dispatch key
}
```

Extends DPM resonance with two independent control flags for fitting observational constraints.

3.4 computeTriadicSolution(system, t) — NEW (UQFF8AstroTriadicModule only)

Simultaneously solves all three triadic arms for a given system and time:

$$\vec{F}_{triadic} = (F_{compressed}(t), F_{resonant}(t), F_{buoyancy}(t))$$

Returns the triadic solution vector as three cdouble values, enabling simultaneous constraint by compressed, resonant, and buoyancy observational data.

4. Source160 Validation Data (Thoughts L10436)

From the Grok Thoughts section analyzing Source160.docx:

4.1 Full $F_{U_{Bi_i}}$ (template-mass systems)

$$F_{U_{Bi_i}} \approx -8.32 \times 10^{217} + i(-6.75 \times 10^{160}) \text{ N}$$

Identical for: **Tycho's SNR, Abell 2256, Tarantula Nebula, NGC 253** — when evaluated at template-mass ($M = 10^{41}$ kg, $r = 10^{21}$ m, $\omega_0 = 10^{-15}$).

4.2 Compressed Integrand per System

$$F_{U_{Bi_i}, integrand} = \sum \text{terms} \approx \begin{cases} 6.16 \times 10^{45} \text{ N} & \text{Abell 2256 } (M = 1.23 \times 10^{45} \text{ kg}) \\ 6.16 \times 10^{39} \text{ N} & \text{Template mass systems} \end{cases}$$

4.3 DPM Resonance per System

$$\text{DPM}_{res} = \frac{g_L \mu_B B_0}{\hbar \omega_0} \approx \begin{cases} 1.76 \times 10^{15} & \text{Tycho's SNR} \\ 1.76 \times 10^{17} & \text{Abell 2256} \\ 1.76 \times 10^{18} & \text{Tarantula, NGC 253} \end{cases}$$

4.4 Buoyancy U_{b1} (all systems universal)

$$U_{b1} = \beta_i V_{infl,UA} \rho_{vac,A} a_{univ} \approx (6 \times 10^{-19} + 6.6 \times 10^{-20} i) \text{ N}$$

4.5 Superconductive U_i (all systems, $t = t_0$)

$$U_i \approx (1.7 \times 10^{-43} + 1.2 \times 10^{-44} i) \text{ N}$$

New physics claim: UQFF operates at a vacuum topology scale (~200 PeV) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.
