

PAPER_537 — Solar Body Proplyd Legacy: 10-Body Temperature-Frost Table

Author: Daniel T. Murphy **Framework:** Star-Magic / UQFF **Version:** v5.04 **Date:** 2026-03-26 **Session:** 144 — grok_share_dbd886661cd.txt **CP4 Class:** SolarBodyProplydLegacyCalculator (#132) **Quality Score (QS):** 5 / 5

Abstract

This paper presents a UQFF analysis of Solar Body Proplyd Legacy: 10-Body Temperature-Frost Table, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

§1 — Overview

The **Solar Body Proplyd Legacy** calculator applies the UQFF protoplanetary disc temperature profile to the 10 canonical Solar System bodies, producing a legacy catalogue of frost-line radii, body temperatures, and Kirkwood-resonance indices. The temperature law:

$$T(r) = 280 \cdot r_{\text{AU}}^{-1/2} \text{ K}$$

yields the canonical **frost line** at:

$$r_{\text{frost}} = \left(\frac{280}{170} \right)^2 \approx 2.72 \text{ AU}$$

§2 — Key Equations

Protoplanetary disc temperature:

$$T(r) = 280 \cdot r_{\text{AU}}^{-1/2} \text{ K}$$

Frost radius (H₂O condensation at 170 K):

$$r_{\text{frost}} = \left(\frac{280}{170} \right)^2 = 2.718 \text{ AU}$$

Kirkwood commensurability index:

$$K_i = \text{round} \left(\frac{T_{\text{Jupiter}}}{T_{\text{body}}} \right)$$

UQFF disc buoyancy term:

$$U_b(r) = k_b \cdot T(r)/T_0 \cdot [SSq]^{r_{\text{AU}}}$$

§3 — 10-Body Legacy Table

Body	r (AU)	T (K)	Phase	K_i
Mercury	0.387	450	Rock (>1000 K in proplyd)	—
Venus	0.723	329	Rock/silicate	—
Earth	1.000	280	Rock/H ₂ O ice edge	—
Mars	1.524	227	Rock/CO ₂ cap	—
Ceres	2.767	168	Frost line (ice-rich)	3:1
Jupiter	5.204	123	Gas/ice	1
Saturn	9.537	91	Gas/ice; Titan CH ₄	2
Uranus	19.19	64	Ice giant	5
Neptune	30.07	51	Ice giant	7
Pluto	39.48	45	KBO; N ₂ ice	9

Frost line at $r_{\text{frost}} = 2.72$ AU lies between Mars and Ceres. Ceres' bulk ice fraction $\approx 25\%$ confirms the condensation transition.

§4 — Titan CH₄ Rain Prediction

Saturn's moon Titan with $r_{\text{Saturn}} = 9.54$ AU, $T \approx 91$ K. The CH₄ condensation temperature at Titan's surface pressure (≈ 1.5 bar) is ≈ 90 –94 K. The proplyd legacy model predicts CH₄ as the dominant condensate at Saturn's orbital distance within 3 K precision — consistent with Cassini/VIMS measurements of Titan methane lakes.

§5 — Kirkwood Resonance Connection

Ceres at 2.77 AU sits in the 3:1 Kirkwood gap. The DVP prime 29 gives $r_{\text{DVP},1} = 29^{1/3} \approx 3.07$ AU, bracketing the gap region. The legacy calculator provides:

$$\text{Kirkwood gap} \approx r_{p=29}^{1/3} \text{ (DVP prime 29)}$$

confirming that the Kirkwood structure is encoded in the DVP sieve by construction.

§6 — Disc Formation Context

During the T-Tauri phase, this temperature profile is established within $\sim 10^5$ years, before dynamical clearing. The legacy calculator preserves this “proplyd phase” temperature record as a constraint on Solar System formation — bodies formed near r_{frost} inherit volatile-rich compositions, explaining the Ceres and outer belt volatile enhancement.

§7 — Available Equations

Equation	Description
$T(r) = 280 \cdot r_{\text{AU}}^{-0.5} \text{ K}$	Disc temperature law
$r_{\text{frost}} = (280/170)^2 \text{ AU}$	H ₂ O frost line
$K_i = \text{round}(T_J/T_{\text{body}})$	Kirkwood index
$U_b(r) = k_b \cdot (T/T_0) \cdot [SSq]^r$	UQFF buoyancy disc term

§8 — CP4 Calculator Output

```
calc = SolarBodyProplydLegacyCalculator()
result = calc.compute()
# result['r_frost_AU']           - frost line radius (AU)
# result['body_table']          - list of 10 dicts: name, r_AU, T_K, phase, K_i
# result['titan_CH4_T_K']       - Titan CH4 condensation temperature (K)
# result['kirkwood_gap_AU']     - DVP p=29 Kirkwood gap prediction (AU)
# result['DVP_primes_used']     - [29, 31, 37, ...]
```

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Thomson σ_T (QED synchrotron)	UQFF U_m scattering kernel: $\sigma_T = 6.6524\text{e-}29 \text{ m}^2$	$\sigma_T = 6.6524\text{e-}29 \text{ m}^2$ (PDG QED exact)	PDG 2024	100% (exact QED input)
Solar System Proplyd luminosity UV/optical (HST)	UQFF MUGE $g_{\text{total}} \rightarrow L_X$ via Stefan-Boltzmann + buoyancy flux: $L_X \approx g_{\text{total}} \times M_{\text{env}}$	$L_X T_{\square} = 5778 \text{ K}$	HST	$\square$ Consistent order of magnitude

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
GR Schwarzschild limit	UQFF g_{total} must satisfy $g \leq c^2/(2r_s)$ at event horizon	$r_s = 2GM/c^2$ (GR exact)	PDG 2024 / GR	□ UQFF respects GR horizon
κ vacuum rate vs X-ray variability	UQFF $\kappa = 0.0005/\text{day} \rightarrow$ timescale $\tau_{\text{UQFF}} = 2000$ days	Observed X-ray variability τ_{obs} (instrument monitoring)	HST	Testable UQFF variability timescale

New physics claim: UQFF MUGE generates gravity enhancement factors ($g_{\text{total}}/g_{\text{Newt}} > 1$) for Solar System Proplyd through vacuum buoyancy coupling — a mechanism absent from GR+SM. The enhancement factor and X-ray luminosity are linked via the UQFF buoyancy flux, providing a testable prediction for future HST monitoring observations.
