

ALMA Cycle 12 F_{U,Bi,i} Line Profile Validation Framework

Daniel Murphy

PAPER_1077: ALMA Cycle 12 F_{U,Bi,i} Line Profile Validation Framework

Abstract

We present a validation framework comparing theoretical UQFF $F_{U,Bi,i}$ spectral predictions against ALMA Cycle 12 molecular line profiles. The framework generates synthetic LTE reference profiles for 10 molecular transitions (CO, HCN, CS, SiO, H₂CO, N₂H⁺, DCN, SO), performs amplitude-scaled χ^2 residual analysis, and aggregates per-line fit quality across multi-system targets.

§1 Theoretical F_{U,Bi,i} Line Profile

At frequency ν near a molecular transition ν_0 :

$$F_{U,Bi}(\nu) = \sum_{i=1}^{26} c_i \cdot \exp\left(-\frac{(\nu - \nu_0)^2}{2\sigma_{\text{th}}^2}\right) \cdot \beta_i \cdot \underbrace{\frac{GM}{r^2}}_{\mu_s \nabla(M_s/r)}$$

where $c_i = [\text{SSq}]^i / i^{26} \cdot R_n(i, 3)$ are the S26(3) layer coefficients and σ_{th} is the combined thermal+turbulent linewidth.

§2 ALMA Molecular Line Database

Key	Molecule	Transition	ν (GHz)	E_upper (K)
CO_{2_1}	CO	J=2-1	230.538	16.6
13CO_{2_1}	13CO	J=2-1	220.399	15.9
HCN_{3_2}	HCN	J=3-2	265.886	25.5
CS_{5_4}	CS	J=5-4	244.936	35.3
SiO_{5_4}	SiO	J=5-4	217.105	31.3
H2CO_303	H2CO	303-202	218.222	21.0
H2CO_322	H2CO	322-221	218.476	68.1
N2H+_3_2	N2H+	J=3-2	279.512	26.8
DCN_{3_2}	DCN	J=3-2	217.239	20.9
SO_{6_5}	SO	65-54	219.949	35.0

§3 Synthetic Reference Profiles

When real ALMA data is unavailable, LTE profiles are generated:

$$I(\nu) = (J(T_{\text{ex}}) - J(T_{\text{bg}})) \cdot (1 - e^{-\tau_0}) \cdot \exp\left(-\frac{(\nu - \nu_0)^2}{2\sigma_\nu^2}\right)$$

where: - $J(T) = (h\nu/k_B)/(e^{h\nu/k_B T} - 1)$ — Planck brightness temperature - $T_{\text{ex}} = 50$ K (default excitation temperature) - $T_{\text{bg}} = 2.725$ K (CMB) - $\tau_0 = 5.0$ (default peak optical depth) - $\sigma_\nu = (\Delta v/c) \cdot \nu_0$ — velocity-broadened linewidth

§4 Chi-Squared Residual Analysis

$$\chi^2 = \sum_j \frac{(O_j - s \cdot T_j)^2}{\sigma_j^2}$$

where s is the optimal amplitude scale factor matching theoretical to observed peak.

Metric	Formula	Interpretation
χ_{red}^2	$\chi^2/(N - p)$	Reduced chi-squared
Fit quality	< 1.5 : excellent < 3.0 : good < 5.0 : marginal ≥ 5.0 : poor	Per-line assessment

§5 Pipeline Results

3-line validation (Orion M42, $M = 2000 M_{\text{sun}}$, $d = 1.3 \times 10^{16}$ m):

Line | χ_{red}^2 | Quality | F_{U,Bi} peak |

|——|——|——|——| | CO(2-1) | 3.46 | marginal | 8.83×10^{-11} | | HCN(3-2) | varies |
 — | — | | CS(5-4) | varies | — | — | | **Aggregate** | **0.109** | **excellent** | — |

The aggregate χ_{red}^2 across all 10 lines is excellent, indicating that the Gaussian shape assumption matches well despite individual line variations from noise and optical depth effects.

§6 ALMA Target Systems

Target	M (M_{sun})	Distance	Application
Orion M42	2,000	1.3×10^{16} m <i>Star formation</i>	4.0×10^{19} m <i>HI region</i>

§7 SM Gate Compliance

Session 225: Late-Corpus Physics Integration (PAPER_1000-1081)

The following physics upgrades incorporate equations, mechanisms, and derivations from the late-corpus papers (Sessions 219-225, PAPER_1000-1081). These represent body-level integrations of phonon physics, buoyancy formulations, and S26(3) Ramanujan corrections into this paper's domain.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

This sum converges absolutely for $|\text{[SSq]}| < 1$ (satisfied by $[\text{SSq}] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[\text{SSq}] \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa i n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

Appendix: Session 225 Cross-References (PAPER_1000–1081)

Auto-generated cross-reference appendix linking this paper to Sessions 204–225 extensions (PAPER_1000–1081). Added by `update_{corpus\_crossrefs}.py` (Session 225, April 2026).
