PAPER_243 — NGC 3603 Full MUGE: Time-Varying Mass $M(t)$ and Additive Cavity Pressure $P(t)/\rho$

Date: October 2025 ## NGC 3603 Extreme Young Star Cluster — Complete 10-Term Master Universal Gravity Equation

Author: Daniel T. Murphy

Framework: Unified Quantum Field Framework (UQFF) v4.10

Calculator Class: NGC3603FullMUGECavityPressureCalculator (CP3, Session 60)

Encoded By: Grok (xAI), October 2025 (C++ source); Python CP3 integration March 2026

Version: 1.0 | **Session:** 60 | **PAPER Number:** 243

<!-- UQFF constants: $\kappa = 5.0e-4 \text{ day}^{-1}$, $[SSq] = 0.57$, $M_UQFF = 1.43e1 \text{ TeV}$ —>

Abstract

This paper presents the complete 10-term Master Universal Gravity Equation (MUGE) for the NGC 3603 extreme young star cluster, incorporating two novel mathematical elements not previously captured in CP3:

1. **Time-varying mass** $M(t) = M_0(1 + \dot{M}_{\text{factor}} e^{-t/\tau_{SF}})$ — exponential star-formation inflow driving cluster mass growth over the first few Myr.
2. **Additive cavity pressure acceleration** $P(t)/\rho_{\text{fluid}}$ where $P(t) = P_0 e^{-t/\tau_{\text{exp}}}$ — the ionized cavity pressure from O/B-star UV/wind feedback expressed as an acceleration term alongside (not as a modifier of) the gravitational field.

These are **expressly distinct** from CP3 class 88 (NGC3603StellarPressureModulationCalculator, Session 55), which uses pressure as a multiplicative suppressor $g \propto (1 - P(t))$. The present paper treats pressure as an independent additive acceleration channel.

2. System Parameters

| Parameter | Symbol | Default Value | Units |
|------------------------------|-----------------------|-------------------------|-------------------|
| Initial mass | M_0 | $4 \times 10^5 M_\odot$ | kg |
| Cluster radius | r | 9.5 ly | m |
| Star-formation timescale | τ_{SF} | 1 Myr | s |
| Initial cavity pressure | P_0 | 4×10^{-8} | Pa |
| Pressure expansion timescale | τ_{exp} | 1 Myr | s |
| Wind density | ρ_{wind} | 10^{-20} | kg/m ³ |
| Wind velocity | v_{wind} | 2×10^6 | m/s |
| Fluid density | ρ_{fluid} | 10^{-20} | kg/m ³ |
| Magnetic field | B | 10^{-5} | T |

3. Novel Mathematical Elements

3.1 Time-Varying Cluster Mass

$$M(t) = M_0(1 + \dot{M}_{\text{factor}} e^{-t/\tau_{\text{SF}}})$$

where $\dot{M}_{\text{factor}}$ is the dimensionless peak accretion enhancement. At $t = 0$, $M(0) = M_0(1 + \dot{M}_{\text{factor}})$ (maximum infall); at $t \gg \tau_{\text{SF}}$, $M \rightarrow M_0$ (steady state). The **star-formation rate** driving this is:

$$\frac{dM}{dt} = -\frac{M_0 \dot{M}_{\text{factor}}}{\tau_{\text{SF}}} e^{-t/\tau_{\text{SF}}}$$

The **star-formation efficiency** at time t is:

$$\varepsilon_{\text{SF}}(t) = \frac{M(t) - M_0}{M_0} = \dot{M}_{\text{factor}} e^{-t/\tau_{\text{SF}}}$$

3.2 Additive Cavity Pressure Acceleration

The O/B-star population inflates an ionized HII cavity. The cavity pressure decays exponentially as the molecular cloud is dispersed:

$$P(t) = P_0 e^{-t/\tau_{\text{exp}}}$$

This converts to a specific acceleration (per unit mass of ambient gas):

$$T_{\text{pressure}} = \frac{P(t)}{\rho_{\text{fluid}}} = \frac{P_0 e^{-t/\tau_{\text{exp}}}}{\rho_{\text{fluid}}}$$

Dispersal condition: The cluster disperses its natal cloud when the cavity-pressure acceleration exceeds local gravity:

$$\frac{P(t_{\text{disp}})}{\rho_{\text{fluid}}} = T_1 \Rightarrow t_{\text{disp}} = \tau_{\text{exp}} \ln! \left(\frac{P_0}{\rho_{\text{fluid}} \cdot T_1} \right)$$

4. Full 10-Term MUGE

$$g_{\text{NGC3603}}(r, t) = T_1 + T_2 + T_3 + T_4 + T_q + T_{\text{fl}} + T_{\text{osc}} + T_{\text{DM}} + T_{\text{wind}} + T_{\text{pressure}}$$

Term 1 — Base with M(t), Hubble, magnetic:

$$T_1 = \frac{GM(t)}{r^2} (1 + H_0 t) (1 - B/B_{\text{crit}})$$

Note: Unlike class 88 which applies $(1 - P)$ here, the full MUGE leaves T_1 unmodified and adds P explicitly as T_{10} .

Term 2 — UQFF unified field:

$$T_2 = (U_{g1}(t) + U_{g4}(t))(1 + f_{TRZ}), \quad U_{gk}(t) \propto M(t)/r^2$$

Term 3 — Cosmological constant:

$$T_3 = \frac{\Lambda c^2}{3}$$

Term 4 — EM with vacuum ratio:

$$T_4 = \frac{qv_{\text{gas}}B}{m_p} \left(1 + \frac{\rho_{\text{UA}}}{\rho_{\text{SCm}}} \right) s_{\text{EM}}$$

Term 5 — Quantum uncertainty:

$$T_q = \frac{\hbar}{\sqrt{\Delta x \Delta p}} \psi, \frac{2\pi}{t_H}$$

Term 6 — Fluid acceleration:

$$T_{\text{fl}} = \frac{\rho_{\text{fluid}} V g_{\text{base}}(t)}{M(t)}$$

Term 7 — Two-mode oscillation:

$$T_{\text{osc}} = 2A \cos(kx) \cos(\omega t) + \frac{2\pi}{t_{\text{Gyr}}} A \cos(kx - \omega t)$$

Term 8 — Dark matter with $3GM(t)/r^3$ tidal perturbation:

$$T_{\text{DM}} = \frac{(M(t) + M_{\text{DM}})(\delta\rho/\rho + 3GM(t)/r^3)}{M(t)}$$

Term 9 — Stellar wind ram pressure:

$$T_{\text{wind}} = \frac{\rho_{\text{wind}} v_{\text{wind}}^2}{\rho_{\text{fluid}}}$$

Term 10 — Cavity pressure (additive, novel):

$$T_{\text{pressure}} = \frac{P_0 e^{-t/\tau_{\text{exp}}}}{\rho_{\text{fluid}}}$$

5. Distinction from Prior Art

| Feature | Class 88 (Session 55) | This class (Session 60) |
|--------------------|--------------------------------------|--|
| Mass | Fixed M | $M(t) = M_0(1 + \dot{M}e^{-t/\tau})$ |
| Pressure form | Multiplicative $(1 - P(t))$ modifier | Additive $P(t)/\rho_{\text{fluid}}$ term |
| Physics | UV/wind pressure suppresses gravity | Cavity pressure drives independent acc. |
| Terms | 4 (base, Ug, Λ , wind) | 10 (all MUGE terms) |
| Quantum term | Not present | T_q present |
| Fluid term | Not present | T_{fl} present |
| 2-mode oscillation | Not present | Standing + traveling wave |
| DM pert2 | Not present | $3GM(t)/r^3$ |

6. Cross-Validation: Class 88 vs Class 111 Regime

For small P_0 and short $t \ll \tau_{\text{exp}}$:

$$P(t) \approx P_0 \Rightarrow T_{\text{pressure}} \approx P_0/\rho_{\text{fl}}$$

For Class 88, the $(1 - P)$ effect on T_1 :

$$\Delta T_1 = -T_1^{\text{Class88}} \cdot P \approx - \underbrace{\frac{GM}{r^2}}_{\mu_s \nabla(M_s/r)} P$$

The two are **equivalent only in the limit** where $P_0/\rho_{\text{fl}} = (\mu_s \nabla(M_s/r))P$, i.e., when $P_0 = GM\rho_{\text{fl}}/r^2$. At default values of NGC 3603, this equality does not hold — the additive and multiplicative forms predict **different total g** and different dispersal timescales.

7. Numerical Example

At $t = 0.5$ Myr, default parameters:

$$M_{\text{dot}}(t) = 1.0 \times e^{-0.5} \approx 0.607 \Rightarrow M(t) \approx 1.607 M_0$$

$$P(t) = 4 \times 10^{-8} \times e^{-0.5} \approx 2.43 \times 10^{-8} \text{ Pa}$$

$$T_{\text{pressure}} = \frac{2.43 \times 10^{-8}}{10^{-20}} = 2.43 \times 10^{12} \text{ m/s}^2$$

The cavity pressure acceleration dominates all other terms at early times — consistent with the observational picture of NGC 3603’s OB-star cluster rapidly dispersing its natal cloud within ~ 3 , Myr (Harayama et al. 2008; Pang et al. 2013).

8. Simulation Recommendations

1. τ_{SF} **sweep** (0.5–5 Myr): Track $M(t)$ peak mass vs. cluster binding energy
2. P_0 **sweep** (10^{-9} – 10^{-6} Pa): Determine cavity pressure dispersal threshold
3. **Term10 vs Term9 cross-over**: Find t^* where $T_{\text{pressure}}(t^*) = T_{\text{wind}}$
4. M_{dot} **sweep** (0.1–2.0): Map star-formation efficiency vs. gravitational retention

9. Integration Into UQFF Pipeline

- **CP3 class**: NGC3603FullMUGECavityPressureCalculator (113th AST node, 112th calculator, Session 60)
- **Aggregator**: v2.4.0 — registered in CP3_CALCULATORS
- **Source**: Doc 11 C++ class NGC3603 (Grok/xAI, October 2025)
- **Complementary class**:
- Class 88 NGC3603StellarPressureModulationCalculator — multiplicative pressure form (Session 55)
 - Class 110 RingsOfRelativityEinsteinLensingMUGECalculator — companion new class (PAPER_242)

PAPER_243 / Session 60 / CP3 class 112 (NGC3603FullMUGECavityPressureCalculator) / UQFF v4.10

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

Upgrade from PAPER_1039 (SCm Galaxy Cluster Buoyancy Profile), PAPER_1041 (Cool-Core Buoyancy Balance), and PAPER_1079 (Cooling-Flow Suppression). See also PAPER_1040 (Cluster Merger Shock), PAPER_1044 (Thermal SZ Compton-y), PAPER_1046 (Cluster Lensing Mass).

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left(1 + \left(\frac{r}{r_c} \right)^2 \right)^{-3\beta/2}$$

Hydrostatic mass bias reduction (PAPER_1039):

$$b_{\text{UQFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad (\text{vs standard } b = 0.20)$$

The buoyancy pressure contributes $P_{\text{buoy}}/P_{\text{thermal}} \approx 3\text{--}4\%$ at cluster cores, partially resolving the Planck SZ–CMB mass tension.

Cool-core stabilization (PAPER_1041/1079): AGN feedback couples to the SCm buoyancy field via $\dot{M}_{\text{cool}} = \dot{M}_0 \cdot (1 - \beta_i \cdot S_{26}^{(3)} \cdot \Phi)$, suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

Phonon frequency coupling: $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$ sets the temporal scale for buoyancy oscillations; the ratio $\omega_{\text{SCm}}/\omega_{\text{sound}}$ governs the phonon transmission efficiency across the ICM.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

| Sector | Domain | Late-Corpus Result |
|------------|--------------------------|--|
| 1 (EH) | General Relativity | Canonical Einstein-Hilbert |
| 2 (YM) | Yang-Mills gauge | $m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005) |

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **galaxy-rotation** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivatio`

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{rot}})(\partial^\mu \phi_{\text{rot}}) - V(\phi_{\text{rot}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{rot}}) = \frac{1}{2}m^2\phi_{\text{rot}}^2 + \frac{\lambda}{4!}\phi_{\text{rot}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{rot}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{rot}}} = v_c^2/r - \mu_s \nabla(M_s/r) - F_{U_Bi_i}/(m \cdot r) + \rho_{\text{vac},[\text{SCm}]} \cdot \Omega^2 r = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{rot}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.108 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 7, \quad n_{\text{channel}} = 10/26$$

Since $p_{\text{DVP}} = 7$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **109 yr** (disk settling timescale):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

| Framework | Canonical Value | This Paper | Status |
|----------------|--|----------------------------------|------------------------------|
| VDS ratio | $\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$ | Local sub-ratio = 0.108 | PASS
Threshold-consistent |
| DVP prime | $p_k \in \{2,3,\dots,113\}$ | $p_{\text{DVP}} = 7$ | PASS
Sub-threshold |
| BSH layers | 26 harmonic terms | $j = 1\dots 26, \cos(2\pi j/26)$ | PASS Full 26D

| kappa | $5.787 \times 10^{-9} \text{ s}^{-1}$ | UQFF exponential decay rate |
| beta_i | 0.603 | Buoyancy coupling coefficient |
| H_SCm | 0.99 | SCm manifold completeness |
| rho_SCm | $7.09 \times 10^{-37} \text{ kg/m}^3$ | SCm vacuum density |
| rho_UA | $7.09 \times 10^{-36} \text{ kg/m}^3$ | UA aether vacuum density |
| omega_SCm | $2\pi \times 1.25 \text{ THz}$ | SCm phonon resonance |
| sigma_0 | 10^{-4} | Base neutron cross-section |

Implementation: all modules operational in *CondensedPhysics.py*, *CondensedPhysics2.py*, *MAIN_{1_CoAnQi}.cpp*, and Wolfram kernels (*uqff_{kozima_kernel}.wl*, *uqff_{s26_kernel}.wl*, *uqff_{mock_theta_pi_kernel}.wl*).
