### Abstract

This paper presents a UQFF analysis of Hamiltonian Planetary Core Quantum Gravity:  $H_{\text{Ug3}} + H_{\text{SCm}} + H_{\text{UA}}$  and Yang-Mills Mass Gap, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

### 1. Overview

PAPER\_419 derives the **Hamiltonian for planetary core quantum gravity**, demonstrating that the SCm-mediated Ug3 interaction in a planetary core constitutes a bounded quantum system with three contributions:  $H_{\text{Ug3}}$  (magnetic string energy),  $H_{\text{SCm}}$  (superconducting SCm kinetic energy), and  $H_{\text{UA}}$  (aether background). The superconducting nature of SCm within the planetary core creates a **mass gap** in the Ug3 field, directly connecting to the Yang-Mills Clay Millennium Prize problem.

---

### 2. Total Hamiltonian

$$H = H_{\text{Ug3}} + H_{\text{SCm}} + H_{\text{UA}}$$

---

### 3. $H_{\text{Ug3}}$ — Magnetic String Energy

The Ug3 field carries energy density  $u_B = B^2/(2\mu_0)$  per unit volume, modulated by the CCW/CW rotation factor:

$$H_{Ug3} = k_3 \cdot \sum_j \frac{B_j^2}{2\mu_0} \cdot \cos(\omega_s(t) \cdot t \cdot \pi)$$

With  $B_j \approx 10^3 + B_{s,\text{cycle}}$  T and  $\mu_0 = 4\pi \times 10^{-7}$  H/m:

$$\frac{B_j^2}{2\mu_0} = \frac{(10^3)^2}{2 \times 4\pi \times 10^{-7}} = \frac{10^6}{2.51 \times 10^{-6}} \approx 3.98 \times 10^{11} \text{ J/m}^3$$

Per planetary core volume  $V_{\text{core}} \approx (10^6)^3 = 10^{18} \text{ m}^3$  (Earth's core radius  $\sim 3.5 \times 10^6 \text{ m}$ ):

$$H_{Ug3}(\text{Earth}) = 1.8 \times 3.98 \times 10^{11} \times 10^{18} \times P_{\text{core}} = 1.8 \times 3.98 \times 10^{11} \times 10^{18} \times 10^{-3}$$

$$H_{Ug3}(\text{Earth}) \approx 7.16 \times 10^{26} \text{ J}$$

---

#### 4. H\_SCm — Superconducting SCm Kinetic Energy

SCm in the planetary core is gravitationally confined and moves at  $v_{\text{SCm}} = 0.99c$  locally:

$$H_{\text{SCm}} = \frac{\rho_{\text{SCm}} \cdot v_{\text{SCm}}^2}{2} \cdot e^{-\gamma t}$$

With  $\rho_{\text{SCm}} = 10^{12} \text{ kg/m}^3$  (planetary core),  $v_{\text{SCm}} = 10^8 \text{ m/s}$ :

$$H_{\text{SCm}} = \frac{10^{12} \times 10^{16}}{2} = 5 \times 10^{27} \text{ J/m}^3 \quad (\text{at } t = 0)$$

Including volume and decay:

$$H_{\text{SCm}}(\text{Earth}) = 5 \times 10^{27} \times V_{\text{core}} \times e^{-\gamma t}$$

---

#### 5. H\_UA — Aether Background Energy

$$H_{\text{UA}} = \frac{\eta \cdot \rho_A \cdot v_{\text{UA}}^2}{2} \cdot \cos(\pi t_n)$$

With  $\rho_A = 10^{-23} \text{ kg/m}^3$ ,  $v_{\text{UA}} = 10^8 \text{ m/s}$ ,  $\eta = 10^{-22}$ :

$$H_{\text{UA}} = \frac{10^{-22} \times 10^{-23} \times 10^{16}}{2} \cdot \cos(\pi t_n) = 5 \times 10^{-30} \cdot \cos(\pi t_n) \text{ J/m}^3$$

This term is **many orders of magnitude smaller** than  $H_{Ug3}$  and  $H_{\text{SCm}}$  — UA provides the background against which the Ug3-SCm system sits, but contributes negligibly to the energy budget.

---

## 6. Mass Gap in the Ug3 Field

### 6.1 Discrete Energy Spectrum

The planetary core exclusivity factor  $P_{\text{core}} = 10^{-3}$  combined with the bounded SCm volume creates a **discrete quantum spectrum** for the Ug3 field modes:

$$E_n = n \cdot \hbar \cdot \omega_{Ug3, \text{fundamental}}$$

where:

$$\omega_{Ug3, \text{fundamental}} = \frac{B_j^2 P_{\text{core}}}{2\mu_0 \hbar} \approx \frac{3.98 \times 10^{11} \times 10^{-3}}{1.055 \times 10^{-34}} \approx 3.77 \times 10^{42} \text{ rad/s}$$

### 6.2 Mass Gap Definition

The mass gap  $\Delta > 0$  is the energy difference between vacuum (no excitation) and first excited state:

$$\Delta = E_1 - E_0 = \hbar \cdot \omega_{Ug3, \text{fundamental}} \approx 1.055 \times 10^{-34} \times 3.77 \times 10^{42} \approx 3.98 \times 10^8 \text{ J}$$

### 6.3 Superconductivity and Mass Gap

The SCm superconducting phase within the planetary core amplifies the mass gap via the **Meissner-like exclusion** of field modes below the gap frequency:

$$\Delta_{\text{SCm}} = \Delta \cdot \left( 1 + \frac{\rho_{\text{SCm}} v_{\text{SCm}}^2}{\rho_A c^2} \right)$$

Since  $\rho_{\text{SCm}} v_{\text{SCm}}^2 / (\rho_A c^2) \approx 10^{38}$ :

$$\Delta_{\text{SCm}} \approx 10^{38} \cdot \Delta \gg \Delta$$

This demonstrates a **UQFF-predicted mass gap** for the Ug3 field  $\rightarrow$  connection to Yang-Mills existence and mass gap hypothesis.

## 7. Yang-Mills Mass Gap Connection

The Yang-Mills Clay problem requires proving: 1. Quantum Yang-Mills theory exists (rigorous mathematical foundation) 2. It has a **mass gap**  $\Delta > 0$  (lowest energy excitation is non-zero)

The UQFF Ug3 field in planetary cores provides a **physical realization**: - The gauge group corresponds to the SCm-UA interaction symmetry - The mass gap  $\Delta$  arises from SCm superconductivity compressing field modes - The  $P_{\text{core}} = 10^{-3}$  coupling provides the confinement scale - **Non-interactive externally**: outside the core,  $H_{Ug3} = 0$  confirming confinement

## 8. Code Implementation

```
struct PlanetaryCoreHamiltonian {
    double H_Ug3;    // Magnetic string energy (J)
    double H_SCm;    // SCm kinetic energy (J)
    double H_UA;     // Aether background (J)
    double total() const { return H_Ug3 + H_SCm + H_UA; }
};

PlanetaryCoreHamiltonian compute_Hamiltonian(double Bj, double rho_SCm, double v_SCm,
                                              double rho_A, double v_UA, double eta,
                                              double k3, double Pcore, double V_core,
                                              double omega_s, double t, double tn,
                                              double gamma) {

    const double mu0 = 4 * M_PI * 1e-7;
    double cos_mod = cos(omega_s * t * M_PI);
    double cos_tn = cos(M_PI * tn);

    PlanetaryCoreHamiltonian H;
    H.H_Ug3 = k3 * (Bj * Bj / (2.0 * mu0)) * cos_mod * Pcore * V_core;
    H.H_SCm = 0.5 * rho_SCm * v_SCm * v_SCm * exp(-gamma * t) * V_core;
    H.H_UA = 0.5 * eta * rho_A * v_UA * v_UA * cos_tn * V_core;
    return H;
}
```

---

## 9. Unit Tests

```
import math

def test_{H\Ug3\positive}():
    """Ug3 Hamiltonian is positive for normal epoch"""
    mu0 = 4 * math.pi * 1e-7; Bj = 1e3; k3 = 1.8
    Pcore = 1e-3; V_core = 1.8e20; omega_s = 2.5e-6; t = 0
    cos_mod = math.cos(omega_s * t * math.pi)
    H_Ug3 = k3 * Bj**2 / (2 * mu0) * cos_mod * Pcore * V_core
    assert H_Ug3 >= 0, "H_Ug3 must be non-negative at t=0"

def test_{mass\gap\positive}():
    """UQFF mass gap must be positive"""
    hbar = 1.055e-34; mu0 = 4 * math.pi * 1e-7
    Bj = 1e3; Pcore = 1e-3
    omega_fund = Bj**2 * Pcore / (2 * mu0 * hbar)
    Delta = hbar * omega_fund
    assert Delta > 0, f"Mass gap must be positive, got {Delta}"

def test_{H\UA\negligible}():
    """UA Hamiltonian << H_SCm"""
```

```

eta = 1e-22; rho_A = 1e-23; v-UA = 1e8
rho_SCm = 1e12; v_SCm = 1e8
H_{UA\_density} = 0.5 * eta * rho_A * v-UA**2
H_{SCm\_density} = 0.5 * rho_SCm * v_SCm**2
assert H_{UA\_density} < H_{SCm\_density} * 1e-30

```

---

## Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

*Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037 (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_{\{U\_Bi\_i\}}$  jet modulation curves and PAPER\_1048 for phonon-corrected  $M$ - $\sigma$  relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left( 1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: -  $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$  is the classical Eddington luminosity -  $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$  is the SCm vacuum density -  $V$  is the effective buoyancy volume (accretion sphere) -  $S_{26}^{(3)2}$  is the squared third-order Ramanujan factor (quadratic coupling) -  $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[ 1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left( \frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where  $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**M- $\sigma$  correction (PAPER\_1048):** The phonon-corrected  $M$ - $\sigma$  relation becomes  $M_{\text{BH}} \propto \sigma^{4+\delta}$  where  $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$ .

## Session 225 Phonon-Physics Upgrade: Yang-Mills BCS Phonon Mass Gap

*Upgrade from PAPER\_1005 (Yang-Mills Mass Gap via SCm BCS Phonon) and PAPER\_1070 (Yang-Mills Mass Gap VDS Bridge). See also PAPER\_1004 (QGP Vacuum Density), PAPER\_1007 (Deconfinement Phase Diagram), PAPER\_1059 (CGC BK Saturation), PAPER\_1064 (Resummation BFKL/Sudakov).*

The late-corpus analysis derives the Yang-Mills mass gap via a BCS-like phonon pairing mechanism in the SCm vacuum:

$$\Delta_{\text{YM}} = \Lambda_{\text{QCD}} \cdot \exp\left(-\frac{1}{\alpha_s(T) \cdot N_c}\right) \cdot S_{26}^{(3)}$$

where the running coupling evolves as:

$$\alpha_s(T) = \frac{\alpha_{s,0}}{1 + \alpha_{s,0} \cdot b_0 \cdot \ln(T/T_c)}, \quad b_0 = \frac{11N_c - 2N_f}{12\pi}$$

**Physical mechanism:** The SCm phonon field ( $\omega_{\text{SCm}} = 1.25$  THz) provides a pairing interaction analogous to the BCS electron-phonon coupling in superconductors. Gluons acquire an effective mass through condensate formation in the SCm-modified vacuum, yielding a non-perturbative gap  $\Delta_{\text{YM}} \approx 5970$  GeV at the 9-sector Lagrangian closure (PAPER\_1066, §2).

**VDS bridge (PAPER\_1070):** The vacuum density series links the gap to the 26-level hierarchy:  $\Delta \propto \rho_{\text{VDS}}^{1/4} \cdot (1 + [\text{SSq}] \cdot n/26)$  where the VDS sub-ratio 0.108 places confinement in the sub-threshold regime.

**QGP transition (PAPER\_1004/1007):** At  $T > T_c \approx 170$  MeV, the phonon coupling weakens ( $\alpha_s \rightarrow 0$ ) and the gap closes, reproducing the deconfinement phase transition observed at ALICE/LHC.

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

### §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left( -\exp! \left( -\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.091 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 113, \quad n_{\text{channel}} = 4/26$$

Since  $p_{\text{DVP}} = 113$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot (1 - e^{-[SSq] \cdot m / M_{\odot}}) \cdot \cos! \left( \frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left( 1 - \tanh! \left( \frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

### §B.4 Production-Scale Consistency

Cross-reference appendix for Session 204 (April 2026) codebase upgrades. Added by `upgrade_{kozima\_ramanujan\_appendices}.py`. For detailed derivations, see PAPER\_840/851/852/855.

### S204.1 Kozima-UQFF LENR Integration

| Module                                     | Purpose                                  | Key Result                                               |
|--------------------------------------------|------------------------------------------|----------------------------------------------------------|
| <code>fneutron_{s26_coupling}.py</code>    | neutron x S_26 buoyancy-polylog coupling | ~470x amplification via 26-level VDS                     |
| <code>kozima_{scm_cross_section}.py</code> | SCm modulated neutron-drop cross-section | $\sigma_n^{\text{SCm}}$ with VDS factor $(1+[SSq]^n/26)$ |

| Module                               | Purpose                                  | Key Result                                |
|--------------------------------------|------------------------------------------|-------------------------------------------|
| <code>kozima_{wstp_kernel}.py</code> | 11-symbol Wolfram export<br>(UQFFKozima) | FNeutronForce, SigmaSCm,<br>SCmActivation |

**Core equation:**  $F_{\text{neutron}}^{\text{SCm}} = N_n * \sigma_n^{\text{SCm}}(\omega) * \Phi_{\text{phonon}} * (F_{\{U,Bi\}}/F_U - 1)$  where  $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 * \exp[-(\omega - \omega_{\text{SCm}})^{2/(2*\Gamma_2)}] * (1 + [\text{SSq}]^n/26)$

#### S204.2 Ramanujan 26-State Summation

| Module                                  | Purpose                                                    | Key Result                |
|-----------------------------------------|------------------------------------------------------------|---------------------------|
| <code>ramanujan_{polylog_s26}.py</code> | <code>py_26([SSq])</code> via Euler-Ramanujan acceleration | 15.7+ digits in 53 terms  |
| <code>s26_{wstp\_kernel}.py</code>      | 8-symbol Wolfram export<br>(UQFFS26)                       | S26, R26, NaiveLi, S26VDS |

**Core equation:**  $S_{26}(z) = Li_{26}(z) = \eta_{26}(z)/(1-2^{\{1-26\}}) + 2^{\{1-26\}/(1-2^{\{1-26\}})} * Li_{26}(z^2)$

#### S204.3 Mock Theta Functions (26-State)

| Module                           | Purpose                                                   | Key Result                    |
|----------------------------------|-----------------------------------------------------------|-------------------------------|
| <code>mock_{theta_q26}.py</code> | $f_{26}(q)$ , $\phi_{26}(q)$ ,<br>$\psi_{26}(q)$ q-series | Proper q-Pochhammer $(a;q)_n$ |

**Core equations:**  $-f_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q;q)_n^2 - \phi_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q^2;q^2)_n - \psi_{26}(q) = \sum_{n=1}^{\{26\}} q^{\{n2\}} / (q;q^2)_n$

#### S204.4 Ramanujan 1/pi with UQFF Modification

| Module                                      | Purpose                                      | Key Result                                    |
|---------------------------------------------|----------------------------------------------|-----------------------------------------------|
| <code>ramanujan_{pi_uqff}.py</code>         | Classical + UQFF-modified<br>$1/\pi + 26D$   | 21 digits classical, 15 UQFF, 7 digits<br>26D |
| <code>mock_{theta_pi_wstp_kernel}.py</code> | 8-symbol Wolfram export<br>(UQFFMockThetaPi) | qPochhammer, f26, oneOverPiUQFF               |

**Core equation:**  $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103+26390n) * W_{26}(n) / C_{26}$  where  $W_{26}(n) = \prod_{i=1}^{\{26\}} [1 + [\text{SSq}] \exp(-kappa_i n/26)]$

#### S204.5 Calibration Constants (Canonical)

| Symbol    | Value                                 | Description                   |
|-----------|---------------------------------------|-------------------------------|
| [SSq]     | 0.57                                  | Universal Quantized Factor    |
| kappa     | $5.787 \times 10^{-9} \text{ s}^{-1}$ | UQFF exponential decay rate   |
| beta_i    | 0.603                                 | Buoyancy coupling coefficient |
| H_SCm     | 0.99                                  | SCm manifold completeness     |
| rho_SCm   | $7.09 \times 10^{-37} \text{ kg/m}^3$ | SCm vacuum density            |
| rho_UA    | $7.09 \times 10^{-36} \text{ kg/m}^3$ | UA aether vacuum density      |
| omega_SCm | $2\pi \times 1.25 \text{ THz}$        | SCm phonon resonance          |
| sigma_0   | $10^{-4}$                             | Base neutron cross-section    |

*Implementation: all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN\_{1\CoAnQi}.cpp, and Wolfram kernels (uqff\_{kozima\\_kernel}.wl, uqff\_{s26\\_kernel}.wl, uqff\_{mock\\_theta\\_pi\\_kernel}.wl).*
