Abstract

NGC 1792 (“The Stellar Forge”) is a starburst spiral galaxy located ~42 million light-years away in Columba, forming stars over 10x faster than the Milky Way at ~10 MM_sun/yr. This paper derives the Master Universal Gravity UQFF equation governing its starburst-driven evolution, incorporating stellar mass growth, supernova feedback suppression, cosmic expansion, and Aether electromagnetic effects. The result $g_{\text{NGC1792}} \approx 1.053 \times 10^{-2} \text{ m/s}^2$ is dominated by the $[UA]/[SCm]$ electromagnetic Aether term.

1. Introduction

NGC 1792 is a classic starburst spiral galaxy with a bright orange core of older stars surrounded by blue young star-forming regions. Its high SFR (~10 MM_sun/yr) is driven by a large gas reservoir, potentially triggered by past tidal interactions. Supernova feedback from rapid star formation injects energy into the ISM, regulating further star formation over ~100 Myr timescales. The UQFF framework captures these dynamics through non-standard Aether and superconductive magnetism terms.

2. Master UQFF Gravity Equation

$$g_{\text{NGC1792}}(r, t) = (G * M) / r^2 * (1 + H(z) * t) * (1 + M_s f(t)) * (1 - F_s n(t)) * (1 + f_T RZ) \\ + q * (vxB) * (1 + rho_{vac} [UA] / rho_{vac} [SCm]) * 10^{-12}$$

3. Long-Form Derivation

Step 1: Base Gravitational Term

$$g_{\text{grav}} = (6.6743e-11 \times 1.989e40) / (3.78e20)^2$$

$$= 1.328e30 / 1.429e41 = 9.293e-12 \text{ m/s}^2$$

Step 2: Starburst Mass Growth

$$M_s f(t) = \text{SFR} t / M_0 = 10 \times 100e6 / 10^{10} = 0.1$$

$$1 + M_s f(t) = 1.1$$

Step 3: Supernova Feedback Adjustment

$$t / \tau_{\text{sn}} = 3.156e15 / 3.156e15 = 1$$

$$F_{\text{sn}}(t) = 0.05 \times (1 - \exp(-1)) = 0.05 \times 0.6321 = 0.031605$$

$$1 - F_{\text{sn}}(t) = 0.968395$$

Step 4: Cosmic Expansion

$$H(z) = 70 \text{xsqrt}(0.3x(1.0095)^3 + 0.7) = 70 \text{xsqrt}(1.00861) = 70.301 \text{km/s/Mpc}$$

$$H(z) = 70.301 \text{e}3 / 3.086 \text{e}22 = 2.278 \text{e} - 18 \text{s}^{-1}$$

$$H(z)xt = 2.278 \text{e} - 18 \times 3.156 \text{e}15 = 7.189 \text{e} - 3$$

$$1 + H(z)xt = 1.007189$$

Step 5: Time-Reversal Correction

$$1 + f_T RZ = 1.1$$

Step 6: Electromagnetic [UA] Term

$$qx(vxB) = 1.602 \text{e} - 19 \times 1 \text{e}6 \times 1 \text{e} - 5 = 1.602 \text{e} - 18 N$$

$$a = 1.602 \text{e} - 18 / 1.673 \text{e} - 27 = 9.575 \text{e}8 \text{m/s}^2$$

$$(1 + \rho_{vac}, [UA] / \rho_{vac}, [SCm]) = 11$$

$$Total = 9.575 \text{e}8 \times 11 \times 10^{-12} = 1.053 \text{e} - 2 \text{m/s}^2$$

Step 7: Final Solution

$$g_N GC1792 = (9.293 \text{e} - 12) \times (1.007189) \times (1.1) \times (0.968395) \times (1.1) + 1.053 \text{e} - 2$$

$$= 1.097 \text{e} - 11 + 1.053 \text{e} - 2$$

$$= 1.053 \text{e} - 2 \text{m/s}^2$$

4. Physical Interpretation

The starburst phase dominates NGC 1792's evolution. The supernova feedback term ($1 - F_{\text{sn}} = 0.968$) captures feedback self-regulation, while the mass growth term ($1 + M_{\text{sf}} = 1.1$) reflects the 10% gas-to-star conversion rate over 100 Myr. The Aether [UA] electromagnetic term ($1.053 \times 10^{-2} \text{ m/s}^2$) exceeds classical gravity by ~ 6 orders of magnitude under UQFF, revealing non-standard vacuum energy as a primary driver.

5. UQFF Framework Advancement

- First UQFF application to a spiral starburst galaxy at 42 Mly
 - Supernova feedback modeled as a damping term on effective buoyancy
 - Starburst star formation mass growth incorporated as additive UQFF correction
 - Demonstrates UQFF scalability to galaxy-scale starburst environments
-

6. Conclusions

The Master UQFF gravity equation for NGC 1792 yields $g_{\text{NGC1792}} \approx 1.053 \times 10^{-2} \text{ m/s}^2$, confirming the Aether electromagnetic term dominates starburst galaxy dynamics under UQFF. The result encodes the balance between starburst mass growth and supernova feedback suppression over a 100 Myr evolutionary timescale.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.097 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 41, \quad n_{\text{channel}} = 9/26$$

Since $p_{\text{DVP}} = 41$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is 10^4 yr (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
