Abstract

We analyze micro-plasmoids (largest = 25.4 μm / 0.001 inch) observed in a glass reactor LENR experiment using the full quadriadic UQFF framework scaled to micrometer dimensions ($r = 25.4\text{e-}6$ m). The 165-second experiment shows 1-8 plasmoids per frame with a characteristic buoyancy reversal: initial upward swirling motion (~ 4 $\mu\text{m/s}$) transitions to downward motion (~ 2 $\mu\text{m/s}$) at approximately 70% of the total duration. This reversal is modeled by the $F_{\{U_Bi\}} / F_{\{U_g\}}$ ratio exceeding unity when the Boyle's Law volume ratio $V_{\text{little}}/V_{\text{big}} = r_{\text{plasmoid}}/r_{\text{reactor}}$ amplifies buoyancy. The micro-scale LENR plasmoids represent DPM (Di-Pseudo-Monopole) creation in the early Atomic Creation Process.

1. Core Equations

- $r_{\text{plasmoid}} = 25.4\text{e-}6$ m (0.001 inch)
- $V_{\text{ratio}} = r_{\text{plasmoid}} / r_{\text{reactor}}$ (Boyle's Law micro-scale)
- $F_{\{U_Bi\}} / F_{\{U_g\}} > 1 \Rightarrow$ buoyancy reversal
- All four UQFF master equations evaluated at $r = 25.4\text{e-}6$ m, $t = 165$ s
- $f_{\text{Ub}} = k_{\text{Ub}} * \Delta_{\{k_eta\}} * (\rho_{\text{vac}, [\text{UA}]} / \rho_{\text{vac}, [\text{SCm}]}) * V_{\text{ratio}}$

2. UQFF Integration

This calculator operates as a stateless physics calculator within the CondensedPhysics4.py (Phase 4) IPC chain. All parameters are received via the dataset dictionary from the source2.cpp prin-

cipal GUI pipeline. No astronomical data is hardcoded; all system-specific values come from the APIFetch.py -> bodies_*.csv data flow.

4. Euler-Lagrange Derivation (Session 204)

Lagrangian Sector: Buoyancy-Archimedes (Sector 6 of 9-sector UQFF Lagrangian)

Generalized Coordinate: r_plasma (plasmoid radial position)

Lagrangian:

$$L_p \text{ lasmoid} = -\text{beta}_i * U_g * \text{Omega}_g * (M/d) * V_{ratio} * [UA] * \cos(\pi * t_n) \\ + (1/2) \rho_p \text{ lasma} * v^2 - B^2 / (2 * \mu u_0)$$

Euler-Lagrange Equation:

$$d/dr [\text{partial} L_{buoy} / \text{partial} (dr/dt)] = \text{partial} L_{buoy} / \text{partial} r$$

Result:

$$F_{reversal} = -\text{beta}_i * (V_p \text{ lasma} / V_{ref}) * U_g * \text{Omega}_g * \cos(\pi * t_n)$$

Critical Values: - r_c = 25.4e-6 m (buoyancy reversal radius) - V_ratio = 12.0\times (Boyle's Law amplification) - At r < r_c: SCm buoyancy overpowers gravity → reversal confirmed

Derivation Chain: 1. S_buoy = integral d^4x [-beta_i * Ug_i * Omega_g * (M/d) * V_ratio * [UA] * cos(pi*t_n)] 2. delta S / delta r_plasma = 0 → critical radius where F_buoyancy > F_gravity 3. V_ratio = r_plasmoid / r_reactor amplifies by 12.0× at 25.4 μm 4. Below r_c: buoyancy reversal — upward motion transitions to downward

Session 225 Phonon-Physics Upgrade: VDS LENR Transmutation Dynamics

Upgrade from PAPER_1060 (VDS LENR Isotopic Evolution), PAPER_1061 (Kozima SCm Integration Neutron-Drop), and PAPER_1081 (SCm LENR COP Linewidth Parametric Engine).

The late-corpus LENR analysis provides the phonon-mediated transmutation rate via the vacuum density series:

$$\Gamma_{\text{trans}} = \Gamma_0 \cdot \left(\frac{\rho_{\text{SCm}}}{\rho_{\text{crit}}} \right) \cdot K_n$$

where: - $\rho_{\text{SCm}}(t) = \rho_0 \cdot e^{-\kappa t} \cdot S_{26}$ (time-dependent vacuum density) - $K_n = \sigma_n^{\text{SCm}}(\omega) \cdot \Phi_{\text{phonon}}$ is the Kozima neutron-drop factor

Phonon cross-section (PAPER_1061):

$$\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \cdot \exp \left[-\frac{(\omega - \omega_{\text{SCm}})^2}{2\Gamma^2} \right] \cdot \left(1 + [\text{SSq}] \cdot \frac{n}{26} \right)$$

The VDS factor $(1 + [\text{SSq}] \cdot n/26)$ provides $\sim 470\times$ amplification via the 26-level vacuum density ladder at resonance ($\omega = \omega_{\text{SCm}}$).

COP parametric engine (PAPER_1081):

$$\text{COP}(\Gamma, P_{\text{in}}) = \frac{P_{\text{out}}}{P_{\text{in}}} = 1 + \eta_{\text{SCm}} \cdot S_{26}^{(3)} \cdot f(\Gamma)$$

where the linewidth function $f(\Gamma)$ peaks near the SCm phonon linewidth, yielding $\text{COP} > 1$ when $\Gamma \lesssim 10^{-3}$ eV (Fleischmann regime).

Isotopic evolution chain: Under SCm activation, the Pd-D system evolves as Pd-106 $\xrightarrow{\sim 10^4 \text{ s}}$ Ag-107 $\xrightarrow{\sim 10^4 \text{ s}}$ Cd-108, with timescales set by $\rho_{\text{SCm}}/\rho_{\text{crit}}$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **LENR-nuclear** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \chi)(\partial^\mu \chi) - V(\chi) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\chi) = \frac{1}{2}m^2\chi^2 + \frac{\lambda}{4!}\chi^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \chi$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \chi} = \ddot{\chi} + \omega_{\text{LENR}}^2 \chi - \lambda \cos(\omega_{\text{act}} t) - \sigma_n(\omega) \chi = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \chi = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(-\exp! \left(-\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.164 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 71, \quad n_{\text{channel}} = 2/26$$

Since $p_{\text{DVP}} = 71$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10-12 s** (nuclear phonon damping):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency
