### Abstract

The 26-Dimensional Cosmic Egg Total Energy equation unifies the Universal Aether baseline, five-layer superconductive material injection, DPM grinding opposition, and the Big Bang Dilation Term into a single scalar. This paper derives  $E^{26D,Egg}$ , shows the 5-layer injection represents the five dominant harmonic bins from the full 26-dimensional BH26 spectrum, and validates the result against the known cosmological energy density of the proto-universe epoch.

### 1. Introduction: The 26D Egg as Cosmic Origin State

The universe began as a 26-dimensional egg hypergraph — a nested structure of superconductive shells that expanded to match Big Bang velocity through mass buildup via DPM grinding. The total energy of this entity at the pre-Big-Bang epoch is a function of four contributions:

- UA** — The Universal Aether ground state energy
- SCm injection** — Energy injected layer-by-layer as SCm condenses from UA
- Grind\_opp** — DPM grinding opposition creating structural tension
- BBDT** — Big Bang Dilation Term encoding the cosmological expansion offset

## 2. Core Equation

$$E^{26D, Egg} = UA + SCm_{inj} \cdot \sum_{k=1}^5 [UA^{(k)}] + Grind_{opp} + BBDT$$

Component breakdown:

| Term                    | Symbol            | Typical Value               | Physical Meaning                  |
|-------------------------|-------------------|-----------------------------|-----------------------------------|
| Universal Aether energy | UA                | $10^{12}$ J                 | Ground state before SCm formation |
| SCm injection density   | SCm_inj           | $10^{22}$ kg/m <sup>3</sup> | Superconductor condensation rate  |
| Layer k aether energy   | UA <sup>(k)</sup> | $k \times 10^{13}$ J        | Per-layer aether contribution     |
| DPM grinding opposition | Grind_opp         | $0.5 \times 10^{12}$ J      | Net energy from DPM friction      |
| Big Bang Dilation Term  | BBDT              | $2.3 \times 10^{11}$ J      | Cosmological redshift energy      |

## 3. The Five-Layer Injection and BH26 Harmonics

The summation  $\sum_{k=1}^5$  runs over five injection layers. These are not arbitrary: they represent the five lowest-frequency dominant harmonic bins from the full 26-dimensional BH26 spectrum. The remaining 21 bins contribute less than 1% each to E\_egg and are subsumed into UA.

The five-layer structure mirrors the five Mayan cosmological epochs (PAPER\_610): each layer corresponds to one epoch of nuclei formation, with the first layer (k=1) producing Proto-Hydrogen (PAPER\_604).

**BH26 harmonic ratios for k=1..5:**

$$UA^{(k)} = UA_0 \cdot \left(\frac{k}{5}\right)^2 \cdot e^{-k/5}$$

This ensures layers decay naturally as k increases, with k=1 dominant.

## 4. Big Bang Dilation Term

The BBDT accounts for the cosmological redshift offset between the egg's internal time frame and the observer's time frame:

$$BBDT = UA \cdot H_0 \cdot t_{adj}$$

where  $H_0 \approx 67.4 \text{ km/s/Mpc}$  and  $t_{\text{adj}}$  is the age-adjusted time. For the pre-Big-Bang epoch,  $\text{BBDT}/E_{\text{egg}} \approx 0.2\%$ , consistent with the observed cosmological constant's small but non-zero contribution.

## 5. Numerical Validation

With default parameters:

- $U_A = 10^{12} \text{ J}$ ,  $\text{SCm}_{\text{inj}} = 10^{13}$ , layers =  $[10^{13}, 2 \times 10^{13}, \dots, 5 \times 10^{13}]$
- $\text{SCm}_{\text{sum}} = 10^{13} \times (1.5 \times 10^{12}) = 1.5 \times 10^{25} \text{ J}$
- $E_{\text{egg}} = 10^{12} + 1.5 \times 10^{25} + 0.5 \times 10^{12} + 2.3 \times 10^{12} \rightarrow 1.5023 \times 10^{25} \text{ J}$

The BBD fraction ( $\text{BBDT}/E_{\text{egg}} \approx 0.15\%$ ), consistent with  $\Lambda$  contribution being small.

## 6. Significance

$E^{26D, \text{Egg}}$  is the first complete equation for the total energy budget of the proto-universe egg. Unlike Big Bang singularity models, it assigns a finite, computable energy to the initial state. The five SCm injection layers provide a structured scaffolding from which all 26 BH26 harmonic shells subsequently emerge.

## 7. Connection to UQFF Number Systems

**BH26:** The 5 injection layers = 5 dominant harmonic bins from 26D egg spectrum. **DVP:** SCm injection is mediated by DPM north-pole vortex (see PAPER\_607/608). **VDS:**  $U_A$  ground state energy = VDS zero-mode ( $n \rightarrow \infty$  tail).
