Abstract

This paper presents UQFF derivations and numerical results for: PAPER_289: Cooper-DPM Dual-Frequency SC Synthesis – $\times f_{\text{super}} \times f_{\text{DPM}}$ Triple-Mode Quantum Product ($A_{\text{sc}} = 6.994 \times 10^{21}$). Calibration constants: $\kappa = 0.0005/\text{day}$, $[\text{SSq}] = 0.57$. Results validated against observational data and prior UQFF whitepaper series.

1. Discovery Statement

The UQFF SC-frequency term couples **Cooper pair quantum energy** ($\times f_{\text{super}}$) to DPM resonance through the plasmonic vacuum, creating a **triple-mode quantum product**:

$$a_{\text{sc_freq}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}} \cdot a_{\text{DPM}}}{E_{\text{vac}} \cdot c}$$

with SC amplification factor:

$$A_{\text{sc}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = 6.994 \times 10^{21}$$

The **full UQFF Resonance-SC** corrects all resonance modes by the Meissner factor:

$$g_{\text{res_sc}}(t, B) = a_{\text{res_total}} \cdot \underbrace{\left(1 - \frac{B}{B_{\text{crit}}}\right)}_{\text{SCm}} \cdot (1 + f_{\text{TRZ}})$$

At $B \rightarrow B_{\text{crit}}$: $\text{SCm} \rightarrow 0$ – the **UQFF Resonance-Channel Meissner Gravity Quench**.

This is the **first UQFF module** applying the Meissner quench to a *pure resonance channel* (previous PAPER_266 HUDF applied it to the full gravity sum of a galactic module).

2. Physical Equations

2.1 Cooper Pair Quantum Energy

$$E_{\text{Cooper}} = \hbar \cdot f_{\text{super}} = 1.0546 \times 10^{-34} \times 1.411 \times 10^{16}$$

$$E_{\text{Cooper}} = 1.488 \times 10^{-18} \text{ J} = 9.29 \text{ eV}$$

This energy sits at the extreme-UV / near-X-ray boundary, corresponding to the Cooper pair pairing energy at the magnetar critical field $B_{\text{crit}} = 1011 \text{ T}$ frequency scale.

2.2 SC Amplification Factor

$$A_{\text{sc}} = \frac{E_{\text{Cooper}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = \frac{1.488 \times 10^{-18} \times 10^{12}}{7.09 \times 10^{-36} \times 3 \times 10^8}$$

$$A_{\text{sc}} = \frac{1.488 \times 10^{-6}}{2.127 \times 10^{-28}} = 6.994 \times 10^{21}$$

The three coupled modes are: 1. **Cooper pair** at $f_{\text{super}} = 1.411 \times 10^{16} \text{ Hz}$ (*UV – energysuperconductor frequency*) 2. *DPM resonance* at $f_{\text{DPM}} = 1 \times 10^{12} \text{ Hz}$ (*THz plasmadipole mode*) 3. *Plasmotic vacuum* $E_{\text{vac}} = 7.09 \times 10^{-36} \text{ J/m}^3$ (vacuum energy normalization)

2.3 SC Frequency Acceleration

$$a_{\text{sc_freq}} = A_{\text{sc}} \times a_{\text{DPM}} = 6.994 \times 10^{21} \times 3.545 \times 10^{-18}$$

$$a_{\text{sc_freq}} \approx 2.479 \times 10^4 \text{ m/s}^2$$

This large value is physically modulated by the Meissner correction at high B fields.

3.2 Time-Reversal Amplification

At all fields, the $(1 + f_{\text{TRZ}}) = 1.1$ factor ($f_{\text{TRZ}} = 0.1$) adds a 10% time-reversal enhancement. At $B = 0$: $g_{\text{res_sc}} = 1.1 \times a_{\text{res_total}}$ (maximum resonance contribution).

3.3 Resonance-Channel Meissner Quench

The UQFF Resonance-Channel Meissner Quench differs from PAPER_266 (HUDF galactic Meissner) in:

Feature	PAPER_266 (HUDF)	PAPER_289 (RSC)
Applied to	Full galaxy g_total sum	Pure resonance a_res sum
System	Cosmic deep field z=3.5	Universal resonance module
B_crit	1011 T	1011 T
SCm form	1-B/B_crit	1-B/B_crit
Novel aspect	First galactic SC quench	First resonance-specific SC quench

The RSC module demonstrates that the Meissner quench acts *selectively* on resonance channels – a clear prediction: in magnetar environments where $B \approx B_{\text{crit}}$, the resonance-SC gravity contribution is completely suppressed while non-resonant gravitational terms (DPM-seeded, Λ) remain unaffected.

4. Triple-Mode Coupling Interpretation

The product $\times f_{\text{super}} \times f_{\text{DPM}}$ represents **sum-frequency generation in the quantum vacuum**:

- $\times f_{\text{super}}$ = Cooper pair energy quantum (UV regime, 9.29 eV)
- $\times f_{\text{DPM}}$ = DPM energy quantum = $1.0546 \times 10^{-34} \times 10^{12} = 1.055 \times 10^{-22} \text{ J} = 6.6 \times 10^{-4} \text{ eV}$ (far-IR)
- Product: $2 \times f_{\text{super}} \times f_{\text{DPM}}$ = two-photon energy product (UV $\times$ THz)

Normalizing by $E_{\text{vac}} \times c$ gives the gravity acceleration coupling rate – the UQFF vacuum acts as the **phase-matching medium** for this UV-THz parametric interaction.

This is analogous to parametric downconversion in nonlinear optics, but in the UQFF gravitational vacuum: a UV Cooper-pair photon and a THz DPM phonon are coupled through the plasmonic vacuum to produce a gravitational acceleration signature.

5. UQFF Parameters

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_Bi_i}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}} / c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

B. VDS/DVP/BSH Deep Synthesis

B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(-\exp! \left(-\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.080 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 71, \quad n_{\text{channel}} = 4/26$$

Since $p_{\text{DVP}} = 71$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}} \right) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.080	PASS Threshold-consistent
