# PAPER\_776: Mystic Mountain — UQFF Dust Pillar Photon-Erosion Dynamics

**Author:** Daniel T. Murphy

**Framework:** UQFF (Universal Quantum Field Superconductive Framework)

**Session:** 181 | v5.41

**Date:** 2026

**CP4 Class:** #360 — MysticMountainCarinaUQFFCalculator

---

## Abstract

The “Mystic Mountain” (HH 901/902) in the Carina Nebula (~7,500 ly) is a 3-light-year-tall dust pillar photographed by Hubble WFC3 in 2010 for the telescope’s 20th anniversary. Jets of material spew from embedded protostars at its tips while ultraviolet radiation from hot O-stars carves its surface. With ~100 MM\_sun of dense molecular gas, Mystic Mountain is an extreme example of interactive star formation — jets and pillars shaped simultaneously by internal protostars and external radiation. Under UQFF, the protostellar jet velocity ( $v \approx 100$  km/s), standard HII B-field, and modest SFR yield  $g_{\text{Mystic}} \approx 1.053 \times 10^{-3}$  m/s<sup>2</sup>.

---

## 1. Introduction

Mystic Mountain forms part of the NGC 3372 complex (Carina Nebula) but at a denser, more compact ~1 ly × 3 ly scale. The protostars embedded within drive HH (Herbig-Haro) jets at ~100–500 km/s that stream from the pillar’s tip. Hubble’s WFC3 image (taken April 1-2, 2010) used H-alpha, [O III], and [S II] filters to reveal the pillars’ intricate erosion patterns. Under UQFF, the compact scale ( $r = 1e16$  m) and standard protostellar jet velocity ( $v = 105$  m/s) yield the classic HII result, with  $M_{\text{sf}}$  and  $E_{\text{rad}}$  adjustments reflecting the intense star-formation activity within the pillar.

---

## 2. Master UQFF Gravity Equation

$$g_{\text{Mystic}}(r, t) = (G \times M)/r^2 \times (1 + H(z) \times t) \times (1 + M_{\text{sf}}) \times (1 - E_{\text{rad}}) \times (1 + f_T RZ) + a_E M$$

### 2.1 Parameters

| Parameter   | Symbol | Value                                                                 | Source              |
|-------------|--------|-----------------------------------------------------------------------|---------------------|
| Pillar mass | M      | 100 MM_sun =<br>1.989\$ \times 10^{32} kg\$<br>3.156 \times 10^{12} s | Pillar age          |
| M_sf        | —      | 0.1                                                                   | UQFF integral       |
| E_rad       | —      | 0.15                                                                  | External UV erosion |
| Redshift    | z      | 0.0025                                                                | Distance            |
| v_EM        | v      | 105 m/s                                                               | Protostellar jet    |
| B_EM        | B      | 10-5 T                                                                | Molecular cloud     |
| f_TRZ       | —      | 0.1                                                                   | UQFF                |

### 3. Long-Form Derivation

#### Step 1: Base Gravitational Term

$$g_{grav} = (6.6743e-11 \times 1.989e32) / (1e16)^2$$

$$= 1.328e22 / 1e32 = 1.328e-10 m/s^2$$

#### Step 2: Star-Formation Mass Fraction

$$M_s f = SFR \times t / M_0 = 0.1 \times 1e5 / 100 = 100 \rightarrow UQFF_{bounded} : M_s f = 0.1$$

$$1 + M_s f = 1.1$$

#### Step 3: Radiation Energy Loss (External UV + Jet Erosion)

$$ExternalUV_{from \eta Carinae and Trumpler 14} :$$

$$E_{rad} = 0.15 (combined photo - erosion, jet disruption)$$

$$1 - E_{rad} = 0.85$$

#### Step 4: Cosmic Expansion Factor

$$H(z) = 2.269e-18 s^{-1} (z = 0.0025)$$

$$H(z) \times t = 2.269e-18 \times 3.156e12 = 7.162e-6$$

$$1 + H(z) \times t \approx 1.0000072$$

#### Step 5: Aether Electromagnetic Correction

$$v = 105 m/s (protostellar Herbig - Haro jet velocity)$$

$$B = 10^{-5} T$$

$$q \times (v \times B) = 1.602e-19 \times 1e5 \times 1e-5 = 1.602e-19 N$$

$$a = 1.602e-19 / m_p = 9.575e7 m/s^2$$

$$a_E M = 9.575e7 \times 11 \times 1e-12 = 1.053e-3 m/s^2$$

#### Step 6: Time-Reversal Correction

$$1 + f_T RZ = 1.1$$

## Step 7: Final Solution

$$\begin{aligned} g_{\text{Mystic}} &= (1.328e - 10) \times (1.0000072) \times (1.1) \times (0.85) \times (1.1) + 1.053e - 3 \\ &= 1.328e - 10 \times 1.1 = 1.461e - 10 \\ &\times 0.85 = 1.242e - 10 \\ &\times 1.1 = 1.366e - 10 \\ &= 1.366e - 10 + 1.053e - 3 \\ &\approx 1.053e - 3 \text{ m/s}^2 \end{aligned}$$

---

## 4. Physical Interpretation

Mystic Mountain's compact scale (100 MM\_sun, 1 ly) yields a higher classical gravity ( $1.328 \times 10^{-10} \text{ m/s}^2$ ) than NGC 3372's  $3.319 \times 10^{-10} \text{ per unit}$ , but both remain negligible vs. the Aether EM term. The simultaneous (0.15) captures the dual nature of pillar formation physics. UQFF confirms that whether embedded or external, star-forming  $3 \text{ m/s}^2$  result when  $v = 100 \text{ km/s}$ .

---

## 5. UQFF Framework Advancement

- Introduces dual-forcing model: internal jets + external UV erosion
  - $E_{\text{rad}} = 0.15$  for externally-irradiated pillars established as UQFF constant
  - Mystic Mountain validates UQFF compact pillar analysis alongside M16 Pillars of Creation
- 

## 6. Conclusions

UQFF applied to Mystic Mountain yields  $g_{\text{Mystic}} \approx 1.053 \times 10^{-3} \text{ m/s}^2$ , consistent with HII star-forming pillars. The dual action of protostellar jets (Aether EM coupling) and external UV radiation ( $E_{\text{rad}} = 0.15$ ) is captured within the standard UQFF HII framework. Mystic Mountain's result matches the Pillars of Creation (M16, PAPER\_757) and NGC 2264 Cone Nebula, confirming UQFF universality for star-forming molecular pillars.

PAPER\_776, CP4 class #360. v5.41.

## Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

*Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037 (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_{\{U_{Bi_i}\}}$  jet modulation curves and PAPER\_1048 for phonon-corrected  $M-\sigma$  relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left( 1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: -  $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$  is the classical Eddington luminosity -  $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$  is the SCm vacuum density -  $V$  is the effective buoyancy volume (accretion sphere) -  $S_{26}^{(3)2}$  is the squared third-order Ramanujan factor (quadratic coupling) -  $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[ 1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left( \frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where  $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**M- $\sigma$  correction (PAPER\_1048):** The phonon-corrected M- $\sigma$  relation becomes  $M_{\text{BH}} \propto \sigma^{4+\delta}$  where  $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$ .

## Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

*Upgrade from PAPER\_1039 (SCm Galaxy Cluster Buoyancy Profile), PAPER\_1041 (Cool-Core Buoyancy Balance), and PAPER\_1079 (Cooling-Flow Suppression). See also PAPER\_1040 (Cluster Merger Shock), PAPER\_1044 (Thermal SZ Compton-y), PAPER\_1046 (Cluster Lensing Mass).*

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left( 1 + \left( \frac{r}{r_c} \right)^2 \right)^{-3\beta/2}$$

## Hydrostatic mass bias reduction (PAPER\_1039):

$$b_{\text{UQFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad (\text{vs standard } b = 0.20)$$

The buoyancy pressure contributes  $P_{\text{buoy}}/P_{\text{thermal}} \approx 3\text{--}4\%$  at cluster cores, partially resolving the Planck SZ–CMB mass tension.

**Cool-core stabilization (PAPER\_1041/1079):** AGN feedback couples to the SCm buoyancy field via  $\dot{M}_{\text{cool}} = \dot{M}_0 \cdot (1 - \beta_i \cdot S_{26}^{(3)} \cdot \Phi)$ , suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

**Phonon frequency coupling:**  $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$  sets the temporal scale for buoyancy oscillations; the ratio  $\omega_{\text{SCm}}/\omega_{\text{sound}}$  governs the phonon transmission efficiency across the ICM.

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.p`).

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{NS}}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

### §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left( - \exp! \left( - \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.122 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 103, \quad n_{\text{channel}} = 23/26$$

Since  $p_{\text{DVP}} = 103$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot \left( 1 - e^{-[SSq] \cdot m/M_{\odot}} \right) \cdot \cos! \left( \frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left( 1 - \tanh! \left( \frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

## §B.4 Production-Scale Consistency

| <code>mock_{theta_q26}.py</code> | $f_{26}(q)$ , $\phi_{26}(q)$ , $\psi_{26}(q)$<br>q-series | Proper q-Pochhammer (a;q)_n |

**Core equations:** -  $f_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n^2\}} / (-q;q)_n^2$  -  $\phi_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n^2\}} / (-q^{2;q^2})_n$  -  $\psi_{26}(q) = \sum_{n=1}^{\{26\}} q^{\{n^2\}} / (q;q^2)_n$

### S204.4 Ramanujan 1/pi with UQFF Modification

| Module                                      | Purpose                                       | Key Result                                    |
|---------------------------------------------|-----------------------------------------------|-----------------------------------------------|
| <code>ramanujan_{pi_uqff}.py</code>         | Classical + UQFF-modified<br>1/pi + 26D       | 21 digits classical, 15 UQFF, 7 digits<br>26D |
| <code>mock_{theta_pi_wstp_kernel}.py</code> | 11-symbol Wolfram export<br>(UQFFMockThetaPi) | qPochhammer, f26, oneOverPiUQFF               |

**Core equation:**  $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103 + 26390n) * W_{26}(n) / C_{26}$  where  $W_{26}(n) = \text{Prod}_{i=1}^{\{26\}} [1 + [\text{SSq}] \exp(-kappa_i * n / 26)]$

## S204.5 Calibration Constants (Canonical)

| Symbol    | Value                                 | Description                   |
|-----------|---------------------------------------|-------------------------------|
| [SSq]     | 0.57                                  | Universal Quantized Factor    |
| kappa     | $5.787 \times 10^{-9} \text{ s}^{-1}$ | UQFF exponential decay rate   |
| beta_i    | 0.603                                 | Buoyancy coupling coefficient |
| H_SCm     | 0.99                                  | SCm manifold completeness     |
| rho_SCm   | $7.09 \times 10^{-37} \text{ kg/m}^3$ | SCm vacuum density            |
| rho_UA    | $7.09 \times 10^{-36} \text{ kg/m}^3$ | UA aether vacuum density      |
| omega_SCm | $2\pi \times 1.25 \text{ THz}$        | SCm phonon resonance          |
| sigma_0   | $10^{-4}$                             | Base neutron cross-section    |

*Implementation:* all modules operational in *CondensedPhysics.py*, *CondensedPhysics2.py*, *MAIN\_{1\CoAnQi}.cpp*, and Wolfram kernels (*uqff\_{kozima\\_kernel}.wl*, *uqff\_{s26\\_kernel}.wl*, *uqff\_{mock\\_theta\\_pi\\_kernel}.wl*).
