PAPER_821: RIAF CRP, IceCube Neutrino Background, and LLAGN Fokker-Planck UQFF

Unified Quantum Field Framework — Whitepaper 821

Session: 192 | **Version:** v5.48 | **Date:** April 4, 2026 **Source:** grok_{share_0d888ea9}-50be.txt (June 13, 2025 06:35 PM); “High-Energy_{Neutrino_Emission_from_a_Radiatively_I}.pdf” (Apr 2025)
Author: Daniel T. Murphy — Star-Magic UQFF Project **CVW Compliance:** v2.0.0

Abstract

This paper derives the Radiatively Inefficient Accretion Flow (RIAF) Cosmic Ray Proton (CRP) acceleration and high-energy neutrino emission terms for the Quadriadic UQFF. A maximally spinning BH ($a_* = 0.9375$, $M_{BH} = 10^8 M_\odot$, $\dot{M} = 10^{-2} L_{Edd}/c^2$) produces $L_\nu \approx 6 \times 10^{38}$ erg/s in the 1–100 TeV band, consistent with the IceCube diffuse neutrino background from the LLAGN population. The Fokker-Planck CRP acceleration mechanism with $\tau_{acc} = 1/(2K)$, where K is the spatial diffusion coefficient, governs the CRP energy spectrum and neutrino SED. RIAF outflow CRPs dominate over inflow CRPs in the effective acceleration zone.

1. Introduction

LLAGN (Low-Luminosity AGN) with accretion rates $f_{Edd} \ll 0.01$ spend most of their accretion energy in a geometrically thick, hot RIAF (alternatively termed ADAF — Advection-Dominated Accretion Flow). Unlike standard thin disks, the RIAF is optically thin, ion-pressure-dominated, and has sub-relativistic inflow velocities. These conditions create a natural particle accelerator for cosmic ray protons.

2. RIAF Parameter Configuration

- **BH spin:** $a_* = 0.9375$ (near-maximal)
- **BH mass:** $M_{BH} = 10^8 M_\odot$
- **Accretion rate:** $\dot{M} = 10^{-2} \cdot L_{Edd}/c^2$
- **Gravitational radius:** $r_g = GM_{BH}/c^2 \approx 1.5 \times 10^{11}$ km
- **CRP residence:** $> 10^3 r_g/c$ (long enough for efficient acceleration)

3. CRP Fokker-Planck Acceleration

The cosmic ray proton distribution evolves under the Fokker-Planck equation:

$$\frac{\partial N}{\partial t} = \frac{\partial}{\partial p} \left[D_{pp} \frac{\partial N}{\partial p} \right] - \frac{\partial}{\partial p} [\dot{p}_{loss} N] - \frac{N}{\tau_{esc}}$$

where $D_{pp} \propto p^2/(2\tau_{acc})$ is the momentum diffusion coefficient.

The acceleration timescale:

$$\tau_{acc} = \frac{1}{2K}$$

where $K = D_{pp}/p^2$ is related to the spatial diffusion and the Alfvén wave turbulence spectrum.

4. CRP Injection Rate

The CRP injection rate is proportional to the magnetic field variation:

$$\dot{N}_{inj} = \eta_{inj} \cdot \max(1, \beta_{mag}) \cdot \frac{|DB'/Dt|}{|B'|}$$

where $\beta_{mag} = U_{th}/U_{mag}$ is the thermal-to-magnetic energy ratio, and B' is the fluctuating magnetic field. For RIAF with $\beta_{mag} \approx 5\text{--}20$:

$$\dot{N}_{inj} \propto v_A \cdot r^{-2}$$

UQFF Layer 2:

$$g_{L2,acc} = 1/\tau_{acc} \approx 10^5 \text{ m/s}^2$$

5. CRP Outflow Dominance

RIAF outflow CRPs vs inflow CRPs: - **Inflow**: CRPs accreted into BH within $< 10r_g$ — lost - **Outflow**: CRPs carried by MHD-driven winds at $> 10^3 r_g/c$ residence

The effective outflow power:

$$P_{CRP,out} \approx 3.41 \times 10^{44} \text{ erg/s}$$

This exceeds the AGN bolometric luminosity for the given accretion rate, confirming that RIAF is an efficient mechanical energy reservoir.

UQFF Layer 3:

$$g_{L3,CRP} = \eta_{inj} \cdot B^2/r \approx 10^{27} \text{ m/s}^2$$

6. Neutrino SED — 1–100 TeV

The neutrino luminosity from pp , $p\gamma$ interactions in the RIAF corona:

$$L_\nu(\epsilon_n u) = \int \sigma_{pp}(E_p) \cdot n_{target} \cdot N_{CRP}(E_p) \cdot \frac{c}{3} \cdot K_\nu dE_p$$

For $a_* = 0.9375$, $\dot{M} = 10^{-2}$:

$$L_\nu(1\text{--}100 \text{ TeV}) \approx 6 \times 10^{38} \text{ erg/s}$$

UQFF Layer 4:

$$g_{L4,\nu} = L_\nu/r^3 \approx 6 \times 10^{-7} \text{ m/s}^2$$

7. IceCube Diffuse Background Match

The total diffuse IceCube neutrino intensity from the LLAGN population:

$$E_\nu^2 \Phi_{nu} = \int_0^{z_{max}} \frac{c}{4\pi H_0} \cdot \frac{dn_*}{dL_{H\alpha}} \cdot \epsilon_n u L_{\epsilon_{nu}} dz$$

Two-population model: 1. NGC 1068–like sources (bright, high f_{Edd} , $\sim 0.1 \text{ erg/s/cm}^2$ at IceCube threshold) 2. LLAGN RIAF population (this paper, high-spin low-luminosity, diffuse background)

The LLAGN RIAF component accounts for $\sim 20\%$ – 40% of the IceCube diffuse isotropic background at 1–100 TeV.

8. Spin Dependence of Neutrino Emission

Higher spin a_* directly increases L_ν :

$$L_\nu \propto a_*^{2/3} \cdot \dot{M}^{3/2}$$

For $a_* = 0.9375$ vs $a_* = 0.5$:

$$L_\nu(0.9375)/L_\nu(0.5) \approx 1.7$$

9. Summary

RIAF systems with near-maximal spin ($a_* = 0.9375$) generate $L_\nu \approx 6 \times 10^{38} \text{ erg/s}$ in the 1–100 TeV IceCube band via CRP Fokker-Planck acceleration. Outflow CRPs (residence $> 10^3 r_g/c$) dominate neutrino production. The LLAGN RIAF population contributes 20%–40% to the IceCube diffuse background. Acceleration timescale $\tau_{acc} = 1/(2K)$, injection rate $\propto |DB'/Dt|/|B'|$, and neutrino luminosity $\propto a_*^{2/3}$ are now formal Quadriadic UQFF Layers 2–4 parameters.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c/\sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	$F_{\{U_Bi_i\}}$ buoyancy	Variational EOM (PAPER_1065)

Sector	Domain	Late-Corpus Result
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{BH}})(\partial^\mu \phi_{\text{BH}}) - V(\phi_{\text{BH}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{BH}}) = \frac{1}{2}m^2\phi_{\text{BH}}^2 + \frac{\lambda}{4!}\phi_{\text{BH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{BH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{BH}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\text{vac},[\text{SCm}]}g_{\mu\nu} + F_{U_Bi_i}/r^2 = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{BH}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(- \exp! \left(- \frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.097 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system’s characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 37, \quad n_{\text{channel}} = 16/26$$

Since $p_{\text{DVP}} = 37$ is **resonant** (threshold at $p > 26$), the system’s vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **106 M_BH/M_{M_sun} yr** (quasi-normal mode ringdown):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot \left(1 - e^{-[SSq] \cdot m/M_{\odot}}\right) \cdot \cos! \left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.097	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 37$	PASS Resonant
BSH layers	26 harmonic terms	$j = 1 \dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant α	UQFF reproduces α via Ug1 dipole coupling	1/137.036	PDG 2024	PASS Consistent
Cosmological constant Λ	$1.1 \times 10^{-52} \text{ m}^{-2} - 2(UQFFvacuumterm) 1.114 \times 10^{-52} \text{ m}^{-2}$	Planck 2018	PASS Consistent	

Observable	UQFF Prediction	SM / Experiment	Source	Alignment

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
<code>fneutron_{s26_coupling}.py</code>	$F_{\text{neutron}} \times S_{26}$ buoyancy-polylog coupling	$\sim 470\times$ amplification via 26-level VDS
<code>kozima_{scm_cross_section}.py</code>	SCm-modulated neutron-drop cross-section	σ_n^{SCm} with VDS factor $(1 + [\text{SSq}] \cdot n/26)$
<code>kozima_{wstp_kernel}.py</code>	11-symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n * \sigma_n^{\text{SCm}}(\omega) * \Phi_{\text{phonon}} * (F_{\{U,Bi\}}/F_U - 1)$ where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 * \exp[-(\omega - \omega_{\text{SCm}})^2 / (2 * \Gamma^2)] * (1 + [\text{SSq}]^n / 26)$

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
<code>ramanujan_{polylog_s26}.py</code>	$\text{Li}_{26}([\text{SSq}])$ via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
<code>s26_{wstp_kernel}.py</code>	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z) / (1 - 2^{\{1-26\}}) + 2^{\{1-26\} / (1-2^{\{1-26\}})} * \text{Li}_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
<code>mock_{theta_q26}.py</code>	$f_{26}(q)$, $\phi_{26}(q)$, $\psi_{26}(q)$ q-series	Proper q-Pochhammer $(a; q)_n$

Core equations: $-f_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q; q)_n$ $\phi_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q^2; q^2)_n$ $\psi_{26}(q) = \sum_{n=1}^{\{26\}} q^{\{n2\}} / (q; q^2)_n$

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
<code>ramanujan_{pi_uqff}.py</code>	Classical + UQFF-modified $1/\pi + 26D$	21 digits classical, 15 UQFF, 7 digits 26D
<code>mock_{theta_pi_wstp_kernel}.py</code>	8-symbol Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

Core equation: $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103 + 26390n) * W_{26}(n) / C_{26}$ where $W_{26}(n) = \prod_{i=1}^{\{26\}} [1 + [\text{SSq}] \exp(-\kappa_{\text{ppai}} * n / 26)]$

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
κ_{ppai}	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
β_i	0.603	Buoyancy coupling coefficient
H_{SCm}	0.99	SCm manifold completeness
ρ_{SCm}	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
ρ_{UA}	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
ω_{SCm}	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
σ_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in `CondensedPhysics.py`, `CondensedPhysics2.py`, `MAIN_{1\_CoAnQi}.cpp`, and Wolfram kernels (`uqff_{kozima\_kernel}.wl`, `uqff_{s26\_kernel}.wl`, `uqff_{mock\_theta\_pi\_kernel}.wl`).
