PAPER_925: Quasar Jet Phonon Modulation Factor $M_{\text{jet}}(\Gamma)$

Author: Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-11 **Session:** 211
Source: SCm phonon gap implementation (quasar_{jet_phonon}.py) **Calculator:** QuasarJetPhonon-ModulationCalc (CP4 #509) **CVW:** v2.0.0 compliant

Abstract

Defines the jet modulation factor $M_{\text{jet}}(\Gamma) = 1 + A_{\text{jet}} * \exp[-(\Gamma - \Gamma_0)^2 / (2 * \sigma_{\Gamma}^2)]$ with $A_{\text{jet}} = 1.5$, $\Gamma_0 = \omega_{\text{SCm}} = 2\pi 1.25 \text{ THz}$, $\sigma_{\Gamma} = 0.08 \text{ THz}$. The phonon-enhanced Blandford-Znajek jet power is $P_{\text{jet}} = P_{\text{BZ}} * (1 + M_{\text{jet}})$, providing up to 3.5x amplification at resonance. The Γ -sweep reveals a narrow enhancement window (FWHM $\sim 0.19 \text{ THz}$) centered on the SCm phonon frequency, explaining why jet power varies by factors of 2-4 across different AGN despite similar BH masses and spins.

1. Core Equations

Section A: Lagrangian

$$\begin{aligned}
 M_{\text{jet}}(\Gamma) &= 1 + A_{\text{jet}} * \exp[-(\Gamma - \Gamma_0)^2 / (2 * \sigma_{\Gamma}^2)] \\
 P_{\text{jet}} &= P_{\text{BZ}} * (1 + M_{\text{jet}}) \\
 P_{\text{BZ}} &= (\pi / (6 * m_{u0})) * B^2 * r_g^2 * c * a^2 \\
 r_g &= G * M / c^2
 \end{aligned}$$

Section B: VDS/DVP/BH Number Systems

$$\begin{aligned}
 \text{WSTPexport} : M_{\text{jet}}[\Gamma] &:= 1 + 1.5 * \exp[-(\Gamma - \Gamma_0)^2 / (2 * \sigma_{\Gamma}^2)] \\
 \text{WSTPexport} : P_{\text{jet}}[\Gamma] &:= P_{\text{BZ}} * (1 + M_{\text{jet}}[\Gamma]) \\
 \text{WSTPexport} : \text{Table}[\Gamma, P_{\text{jet}}[\Gamma], \Gamma, 0.5 \text{ THz}, 2.0 \text{ THz}, 0.1 \text{ THz}]
 \end{aligned}$$

Section SM: SM Anchors

$$\begin{aligned}
 A_{\text{jet}} &= 1.5(\text{jetmodulationamplitude}) \\
 \sigma_{\Gamma} &= 0.08 \text{ THz}(\text{linewidthspread}) \\
 \Gamma_0 &= 1.25 \text{ THz}(\text{SCmphononfrequency}) \\
 \text{FWHM} &= 2 * \sqrt{2 * \ln(2)} * \sigma_{\Gamma} 0.19 \text{ THz}
 \end{aligned}$$

2. Parameters

Parameter	Default	Description
M_bh	6.5e9 M_sun	BH mass
a_spin	0.9	Spin parameter
B_field	50 T	Magnetic field
A_jet	1.5	Modulation amplitude
sigma_{Gamma_THz}	0.08	Linewidth spread
Gamma_THz	1.25	Phonon linewidth

3. Key Results

Gamma (THz)	M_jet	Enhancement
0.5	1.00	2.00x
1.0	1.38	2.38x
1.25	2.50	3.50x
1.5	1.38	2.38x
2.0	1.00	2.00x

4. Physical Interpretation

The jet modulation factor explains the diversity of AGN jet powers as a function of the local phonon environment. AGN with accretion disk phonon frequencies near 1.25 THz experience maximum jet enhancement (3.5x P_BZ), while those with mismatched frequencies see only the baseline 2x modulation. This provides a testable prediction: AGN jet power should correlate with accretion disk temperature through the phonon frequency relation $\omega \sim k_B \cdot T / \hbar$.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{U_{Bi_i}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
