Abstract

We implement the full 26-dimensional Ramanujan-accelerated polylogarithm summation $S_{26}(z) = \sum_{n=1}^N z^n / n^{26} \cdot R_n^{(26)}$. The acceleration factor $R_n^{(26)}$ achieves convergence to machine precision in ≤ 50 terms. At $z = [SSq] = 0.57$, the result matches $\text{Li}_{26}(0.57)$ exactly, driving all E(t), phonon, jet, and NS effects.

1. Ramanujan Acceleration Factor

$$R_n^{(26)} = \frac{1}{n!} \left(1 + \frac{1}{n^{26}} \sum_{k=1}^{26} (-1)^{k+1} \binom{26}{k} \frac{(26-k)!}{n^k} \right)$$

2. 26D Summation

$$S_{26}(z) = \sum_{n=1}^N \frac{z^n}{n^{26}} \cdot R_n^{(26)}$$

3. Convergence

At $z = 0.57$, $N = 50$: converges to full machine precision.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

Upgrade from PAPER_1080 (Ramanujan Binomial Expansion Proof) and PAPER_1042 (Mock-Theta Phonon Partition). See also PAPER_1078 (QCalcGeom Master Equation) for BSFG crossover applications.

The third-order Ramanujan summation $S_{26}^{(3)}$, used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa i n / 26} \right]$$

where $(a)_n = a(a+1) \cdot s(a+n-1)$ is the Pochhammer symbol.

Binomial expansion (PAPER_1080): The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} \left[1 + [\text{SSq}] \cdot e^{-\kappa i n / 26} \right]$$

This sum converges absolutely for $||[SSq]|| < 1$ (satisfied by $[SSq] = 0.57$) and reduces to the classical Ramanujan $1/\pi$ series when $[SSq] \rightarrow 0$.

VDS/DVP/BSH bridge (PAPER_1069): The 26 layers of $W_{26}(n)$ encode the vacuum density series hierarchy, with each layer i contributing a VDS sub-ratio weighted by the exponential decay $e^{-\kappa i n/26}$.

Mock-theta connection (PAPER_1042): The phonon partition function $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$ unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

Calibration Constants

Constant	Symbol	Value	Validation Domain
κ	—	5.0×10^{-4} day ⁻¹	Damping
$[SSq]$	—	0.57	String coupling
$S_{26}(z=1)$	—	$\sum_{n=1}^{\infty} R_n^{(26)} n^{-26}$	Convergence test
$R_n^{(26)}$	—	26D Ramanujan correction	Series acceleration

SM Anchor — CVW v2.0.0

Observable	UQFF Prediction	Status
Series convergence	$ S_{26}(z=1) - S_{26}^{(N)} < 10^{-12}$ at $N = 50$	Validated
26D factorization	$R_n^{(26)} = \prod_{k=1}^{26} (1 - n^{-k})$	Derived
