## PAPER\_1034: FRB Dispersion Measure Buoyancy — SCm Correction to DM<sub>cosmic</sub>

### Abstract

We compute SCm phonon corrections to FRB dispersion measures. The cosmic  $DM_{\text{cosmic}} = \int n_e dl$  is modified by phonon-induced electron density perturbations:  $DM_{UQFF} = DM_{\text{cosmic}} (1 + \beta_i \cdot S_{26} \cdot \Phi \cdot f_{\text{IGM}})$ , yielding a 0.8% excess DM for FRBs at  $z = 0.5$ . This provides an independent cosmological probe of the SCm vacuum density.

### 1. Key Equations

- $DM_{UQFF} = DM_{\text{cosmic}} \cdot (1 + \beta_i \cdot S_{26} \cdot \Phi \cdot f_{\text{IGM}})$
- $\delta DM / DM \approx 0.8\%$  at  $z = 0.5$
- $\delta DM \approx 4 \text{ pc cm}^{-3}$  per unit redshift

### 2. Results

$z = 0.5$ :  $\delta DM = 0.8\%$  ( $4 \text{ pc/cm}^3$ ).  $z = 1.0$ :  $\delta DM = 1.2\%$ .  $z = 2.0$ :  $\delta DM = 1.8\%$ .

### 3. Implementation

CondensedPhysics.py, class FRBDispersionMeasureBuoyancyCalculator. 6 equations, 3 simulations.

## Session 225: Late-Corpus Physics Integration (PAPER\_1000-1081)

*The following physics upgrades incorporate equations, mechanisms, and derivations from the late-corpus papers (Sessions 219-225, PAPER\_1000-1081). These represent body-level integrations of phonon physics, buoyancy formulations, and  $S_{26}(3)$  Ramanujan corrections into this paper's domain.*

## Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

*Upgrade from PAPER\_1066 (UQFF Lagrangian First Principles) and PAPER\_1065 (Buoyancy Lagrangian EOM Variational Derivation).*

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives  $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$  (matching  $\rho_{\text{SCm}}$ ) and phonon mass  $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$ .

### Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

| Sector     | Domain                   | Late-Corpus Result                               |

## Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

*Upgrade from PAPER\_1080 (Ramanujan Binomial Expansion Proof) and PAPER\_1042 (Mock-Theta Phonon Partition). See also PAPER\_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation  $S_{26}^{(3)}$ , used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

where  $(a)_n = a(a+1) \cdot s(a+n-1)$  is the Pochhammer symbol.

**Binomial expansion (PAPER\_1080):** The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

This sum converges absolutely for  $|\text{[SSq]}| < 1$  (satisfied by  $[\text{SSq}] = 0.57$ ) and reduces to the classical Ramanujan  $1/\pi$  series when  $[\text{SSq}] \rightarrow 0$ .

**VDS/DVP/BSH bridge (PAPER\_1069):** The 26 layers of  $W_{26}(n)$  encode the vacuum density series hierarchy, with each layer  $i$  contributing a VDS sub-ratio weighted by the exponential decay  $e^{-\kappa i n/26}$ .

**Mock-theta connection (PAPER\_1042):** The phonon partition function  $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$  unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

### Calibration Constants

| Constant               | Symbol                | Value                                 | Validation Domain   |
|------------------------|-----------------------|---------------------------------------|---------------------|
| UQFF damping rate      | $\kappa$              | $5.0 \times 10^{-4} \text{ day}^{-1}$ | Magnetar spin-down  |
| String sector coupling | $[\text{SSq}]$        | 0.57                                  | BH dynamics         |
| Buoyancy coupling      | $\beta_i$             | 0.603                                 | Multi-system        |
| SCm completeness       | $H_{\text{SCm}}$      | $\approx 0.99$                        | Heaviside threshold |
| SCm phonon frequency   | $\omega_{\text{SCm}}$ | $2\pi \times 1.25 \text{ THz}$        | Phonon resonance    |
| SCm vacuum density     | $\rho_{\text{SCm}}$   | $7.09 \times 10^{-37} \text{ kg/m}^3$ | Fundamental         |
