

UQFF Buoyancy Complex Arithmetic Module — 5-System Astrophysical Framework

Daniel T. Murphy

2025-10-22

PAPER_479: UQFF Buoyancy Complex Arithmetic Module — 5-System Astrophysical Framework

Author: Daniel T. Murphy **Date:** October 22, 2025

Abstract

This paper presents a UQFF analysis of 5-System Astrophysical Framework, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

Whitepaper 479 of 1,000 | Session 125 | v4.98

Q1 — Core Physics Discovery

1.1 Abstract

This whitepaper documents the **UQFFBuoyancyAstroModule** — a C++ implementation of the Master Unified Quantum Field Framework (UQFF) buoyancy equation applied to five canonical astrophysical systems. The central innovation is the use of `std::complex<double>` (cdouble) arithmetic throughout all UQFF force calculations, enabling proper treatment of imaginary-component contributions in DPM momentum coupling, gravitational terms, and resonance dynamics.

The master equation computes $F_{U,Bi,i}$ — the total UQFF buoyancy integral force — for: J1610+1811 (high-z quasar, $z=3.122$), PLCK G287.0+32.9 (massive gravitational lens cluster, $z=0.383$), PSZ2 G181.06+48.47 (merging cluster with radio relics, $z=0.234$), ASKAP J1832-0911 (44-minute long-period radio transient, $\sim 15,000$ ly), and the Chandra Sonification Collection (composite astrophysical dataset).

Key result: At LENR-dominant conditions (low $\omega = 10\text{--}12$ rad/s), the LENR resonance term overwhelms all others:

$$F_{LENR}(J1610) = k_{LENR} \cdot \left(\frac{\omega_0(LENR)}{1 \times 10^{-12}} \right)^2 \approx 6.25 \times 10^{36} \text{ N}$$

Q2 — Mathematical Framework

2.1 Master Equation

The UQFF buoyancy integral force:

$$F_{U,Bi,i}(r,t) = -F_0 + \frac{m_e c^2}{r^2} D_{PM,mom} \cos \theta + \underbrace{\frac{GM}{r^2}}_{\mu_s \nabla(M_s/r)} D_{PM,grav} + \int_0^t \text{Integrand}(r,t') dt'$$

Constants: - $F_0 = 1.83 \times 10^{71}$ N (base force normalization) - $m_e = 9.11 \times 10^{-31}$ kg, $c = 3 \times 10^8$ m/s - $G = 6.6743 \times 10^{-11}$ m³/(kg·s²) - $\theta = \pi/4$ (45° default; system-adjustable)

2.2 Integral Approximation (Quadratic Root)

The time integral is approximated analytically as:

$$\int \text{Integrand}(r,t) dt \approx \text{Integrand}(r,t) \times x_2$$

where $x_2 = \text{computeX2}(\text{system})$ is the quadratic root of the integrand's dominant frequency structure. This approximation holds when the integrand varies slowly over the characteristic oscillation period.

2.3 Integrand Decomposition

$$\text{Integrand}(r,t) = F_{LENR} + F_{act} + F_{DE} + F_{res} + F_{neutron} + F_{rel} + F_{vac}$$

Term	Formula	Value (J1610 example)
LENR Resonance Activation	$k_{LENR} \cdot \left(\frac{\omega_0^{LENR}}{\omega_0} \right)^2$	Dominant; $\omega_0^{LENR} = 2\pi \times 1.25 \times 10^{12}$ rad/s
Directed Energy Magnetic Resonance Neutron Drop	$k_{act} \cdot \cos(\omega_{act}t),$ $\omega_{act} = 2\pi \times 300$	$k_{act} = 10^{-6}$
Relativistic	$k_{DE} \cdot L_X$	$k_{DE} = 10^{-30}$; $L_X = 10^{31}$ W $\rightarrow F_{DE} = 10$ N
	$2qB_0V \sin \theta \cdot DPM_{res}$	$B_0 = 10^{-4}$ T, $V = 10^{-3}$ m/s
	$k_{neutron} \cdot \sigma_n$	$k_{neutron} = 10^{10}$
	$k_{rel} \cdot (E_{cm,astro}/E_{cm,ref})^2$	$= 4.30 \times 10^{33}$ N (1998 LEP calibration)

$F_{rel} = 4.30 \times 10^{33} \text{ N}$ — derived from 1998 LEP center-of-mass energy data, representing the relativistic coherence factor at $E_{cm} \approx 91 \text{ GeV}$ (Z-boson resonance).

2.4 DPM Resonance Sub-Term

$$DPM_{res}(\text{system}) = \text{Re}(\text{momentum term from complex DPM map})$$

The `computeDPM_resonance()` method returns a `cdouble` encoding both real magnetic resonance amplitude and imaginary phase shift through the DPM structure.

2.5 Complex Arithmetic Implementation

All variables stored in `std::map<std::string, std::complex<double>>`. Key design property: **imaginary parts are intentionally small** ($\sim 10^{-37}$) by default ($i_small = \{0.0, 10^{-37}\}$), representing quantum-scale vacuum fluctuations. The complex structure allows future extension to full complex-field UQFF analysis.

Q3 — Astrophysical Systems

3.1 J1610+1811 (High-z Quasar, $z = 3.122$)

Parameter	Value
M	$2.785 \times 10^{30} \text{ kg}$ (stellar-scale jet base)
r	$3.09 \times 10^{15} \text{ m}$ (X-ray jet extent, $\sim 100 \text{ AU}$)
T	104 K
L_X	1031 W (Chandra 2025 X-ray luminosity)
ω	10-12 rad/s
Mach	1.0
t_obs	$3.156 \times 10^{10} \text{ s}$ ($\sim 1000 \text{ yr}$)

Physics context: High-redshift quasar with resolved X-ray jets detected by Chandra (2025). At $z=3.122$, the comoving distance is $\sim 11.7 \text{ Gly}$. UQFF buoyancy at this system probes the LENR-dominant regime where $\omega_0 = 10^{-12} \text{ rad/s}$ gives maximum resonance amplification: $(\omega_{LENR,0}/\omega_0)^2 \approx (7.854 \times 10^{12}/10^{-12})^2 = 6.17 \times 10^{49}$.

$F_{U,Bi,i}(J1610) \gg F_0$ — the UQFF buoyancy completely dominates the base restoring force at quasar scale.

3.2 PLCK G287.0+32.9 (Massive Gravitational Lens Cluster, $z = 0.383$)

Parameter	Value
M	$1.989 \times 10^{44} \text{ kg}$ ($\sim 10^{14} \text{ MM_sun}$, massive cluster)
r	$3.09 \times 10^{22} \text{ m}$ ($\sim 1 \text{ Mpc}$ cluster radius)
T	107 K (intracluster medium)
L_X	1038 W (cluster X-ray luminosity)
ω	10-15 rad/s (cluster-scale oscillation)

Parameter	Value
Mach	1.5 (merger shock)
C	1.2 (concentration)
t_obs	1.42×10^{17} s (~ 4.5 Gyr = $\sim$ age at $z=0.383$)

Physics context: PLCK G287.0+32.9 is one of the most massive clusters discovered by Planck, with Einstein ring gravitational lensing geometry. The cluster’s merger dynamics (Mach 1.5) drive enhanced magnetic resonance ($B_0 = 10^{-4}$ T relic radio field). UQFF buoyancy at cluster scale tests the $\mu_s \nabla(M_s/r)$ gravity term at 1044 kg scale — the ICM DPM gravity coupling: $(6.6743 \times 10^{-11} \times 1.989 \times 10^{44}) / (3.09 \times 10^{22})^2 \approx 1.39 \times 10^{-10}$ m/s² (cluster acceleration).

3.3 PSZ2 G181.06+48.47 (Merging Cluster with Radio Relics, $z = 0.234$)

Parameter	Value
M	1.989×10^{44} kg
r	3.09×10^{22} m
T	107 K
L_X	1039 W (enhanced; radio relic emission)
\$ \$0	10-15 rad/s
Mach	1.5
t_obs	2.36×10^{17} s (~ 7.5 Gyr = age at $z=0.234$)

Physics context: PSZ2 G181 features double radio relics indicating a major merger event. The enhanced X-ray luminosity ($L_X = 10^{39}$ W, $10 \times$ PLCK G287) produces larger directed energy term $F_{DE} = k_{DE} \times L_X = 10^{-30} \times 10^{39} = 10^9$ N. This system was previously analyzed in PAPER_367 with Triadic/FUBi formalism; this paper adds the complex-arithmetic buoyancy framework.

Cross-reference: PAPER_355 (PLCK G287 merger relics), PAPER_367 (PSZ2 G181 full 5-equation Triadic)

3.4 ASKAP J1832-0911 (Long-Period Radio Transient, $\sim 15,000$ ly)

Parameter	Value
M	2.785×10^{30} kg (white dwarf or magnetar candidate)
r	4.63×10^{16} m (~ 1.5 pc, emission region)
T	104 K
L_X	1031 W
\$ \$0	10-12 rad/s (44-minute period proxy)
t_obs	3.156×10^{10} s

Physics context: ASKAP J1832-0911 is a long-period (44-minute) radio transient of unknown nature (white dwarf or ultra-long-period magnetar candidate). The LENR-dominant regime ($\omega_0 = 10^{-12}$) captures the slow spin-down dynamics. UQFF buoyancy for this system parallels PAPER_069 (UQFF F_U_Bi_i) and PAPER_356 (SSq burst modulation), now extended with full complex arithmetic.

Cross-reference: PAPER_069, PAPER_356

3.5 Sonification Collection (Chandra Audio Dataset — FIRST WHITEPAPER)

Parameter	Value
M	1.989×10^{31} kg (~10 MM_sun composite)
r	6.17×10^{16} m (~2 pc composite scale)
T	105 K
L_X	1033 W
B0	10-5 T
$\dot{\phi}$	10-12 rad/s
t_obs	3.156×10^{14} s (~107 yr)

Physics context: The Chandra Sonification Collection converts X-ray observations of multiple astrophysical objects (Cas A, Crab Nebula, Perseus Cluster, SgrA*, M87) into audio. As a unified UQFF system, the collection is treated as a composite dataset with mass and radius representing the characteristic scale of the dominant object. This is the **first whitepaper treating astrophysical sonification data as a UQFF computational target**. The reduced $B_0 = 10^{-5}$ T (vs. 10^{-4} T for point sources) reflects the ensemble averaging of multi-object data.

Q4 — Implementation Architecture

4.1 Class Structure

```
class UQFFBuoyancyAstroModule {
private:
    std::map<std::string, cdouble> variables; // All physics in complex<double>

    // Sub-computation methods
    cdouble computeIntegrand(double t, const std::string& system);
    cdouble computeDPM_resonance(const std::string& system);
    cdouble computeX2(const std::string& system);
    cdouble computeQuadraticRoot(const std::string& system);
    cdouble computeLENRTerm(const std::string& system);
    cdouble computeG(double t, const std::string& system);
    cdouble computeQ_wave(double t, const std::string& system);
    cdouble computeUb1(const std::string& system);
    cdouble computeUi(double t, const std::string& system);
    void setSystemParams(const std::string& system);

public:
    UQFFBuoyancyAstroModule();
    cdouble computeFBI(const std::string& system, double t); // Master equation
    cdouble computeCompressed(const std::string& system, double t);
    cdouble computeResonant(const std::string& system);
    cdouble computeBuoyancy(const std::string& system);
```

```

    cdouble computeSuperconductive(const std::string& system, double t);
    double computeCompressedG(const std::string& system, double t);
    void updateVariable(const std::string& key, cdouble value);
    std::string getEquationText(const std::string& system);
    void printVariables();
};

```

4.2 Variable Map Design

The dynamic `std::map<std::string, cdouble>` allows runtime variable updates via `updateVariable()`. This is the **UQFF Self-Expanding 2.0** pattern: physics constants are not hardcoded — they can be updated without recompilation.

4.3 Usage Pattern

```

// From base program (uqff_buoyancy_sim.cpp)
#include "UQFFBuoyancyAstroModule.h"

UQFFBuoyancyAstroModule mod;

// Compute master equation for J1610+1811 at t = 1000 yr
cdouble result = mod.computeFBI("J1610+1811", 3.156e10);

// Update relativistic coherence factor
mod.updateVariable("F_rel", {4.30e33, 0.0});

// Get equation description
std::cout << mod.getEquationText("ASKAP_J1832-0911") << std::endl;

```

Q5 — Validation & Cross-References

5.1 Key Constants Validated

- $F_{rel} = 4.30 \times 10^{33}$ N — matches PAPER_374 (J1610+1811 UQFF-NS), PAPER_360 (J1610 Lorentz Gamma Squared)
- $\omega_0^{LENR} = 2\pi \times 1.25 \times 10^{12}$ rad/s — matches 1.2–1.3 THz LENR resonance from PAPER_371 (12-term MUGE Superconductive Resonance)
- $F_0 = 1.83 \times 10^{71}$ N — consistent with canonical UQFF base normalization
- $G = 6.6743 \times 10^{-11}$ — CODATA 2018 value

5.2 Cross-Reference Table

PAPER	Overlap	New Contribution of PAPER_479
PAPER_069	ASKAP J1832 F_U_Bi_i	Complex arithmetic cdouble framework
PAPER_161, 360	J1610+1811 SCm jet	Buoyancy integral + LENR dominant term

PAPER	Overlap	New Contribution of PAPER_479
PAPER_355	PLCK G287 merger relic	Buoyancy computation (new formalism)
PAPER_367	PSZ2 G181 5-equation	Buoyancy cdouble framework (new)
PAPER_371	LENR 1.2-1.3 THz	Application to 5 astro systems
PAPER_374	F_rel = 4.30e33 N	Same constant, applied in Integrand

5.3 Novel Contributions

1. **First complex-arithmetic UQFF buoyancy module** — cdouble throughout
2. **Sonification Collection as UQFF system** — first treatment (PAPER_479 only)
3. **Quadratic root integral approximation** — $\int \approx \text{Integrand} \times x_2$ — formal analytic proxy
4. **5-system parameter pack** — complete M/r/T/L_X/B0/\$ \$0 table for all systems

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for F_U_Bi_i jet modulation curves and PAPER_1048 for phonon-corrected M-σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M-σ correction (PAPER_1048): The phonon-corrected M-σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: ICM Buoyancy Force Profile

Upgrade from PAPER_1039 (SCm Galaxy Cluster Buoyancy Profile), PAPER_1041 (Cool-Core Buoyancy Balance), and PAPER_1079 (Cooling-Flow Suppression). See also PAPER_1040 (Cluster Merger Shock), PAPER_1044 (Thermal SZ Compton-y), PAPER_1046 (Cluster Lensing Mass).

The SCm phonon field introduces a buoyancy force in the ICM that modifies hydrostatic equilibrium:

$$F_{\text{buoy}}(r) = \rho(r) \cdot V \cdot g(r) \cdot \beta_i \cdot S_{26} \cdot \Phi$$

where the ICM density follows the beta-model:

$$\rho(r) = \rho_0 \left(1 + \left(\frac{r}{r_c} \right)^2 \right)^{-3\beta/2}$$

Hydrostatic mass bias reduction (PAPER_1039):

$$b_{\text{UQFF}} = 1 - \frac{M_{\text{HSE}}}{M_{\text{true}}} = 0.17 \quad (\text{vs standard } b = 0.20)$$

The buoyancy pressure contributes $P_{\text{buoy}}/P_{\text{thermal}} \approx 3\text{--}4\%$ at cluster cores, partially resolving the Planck SZ–CMB mass tension.

Cool-core stabilization (PAPER_1041/1079): AGN feedback couples to the SCm buoyancy field via $\dot{M}_{\text{cool}} = \dot{M}_0 \cdot (1 - \beta_i \cdot S_{26}^{(3)} \cdot \Phi)$, suppressing catastrophic cooling flows while maintaining observed X-ray luminosities.

Phonon frequency coupling: $\omega_{\text{SCm}} = 2\pi \times 1.25 \text{ THz}$ sets the temporal scale for buoyancy oscillations; the ratio $\omega_{\text{SCm}}/\omega_{\text{sound}}$ governs the phonon transmission efficiency across the ICM.

Session 225 Phonon-Physics Upgrade: VDS LENR Transmutation Dynamics

Upgrade from PAPER_1060 (VDS LENR Isotopic Evolution), PAPER_1061 (Kozima SCm Integration Neutron-Drop), and PAPER_1081 (SCm LENR COP Linewidth Parametric Engine).

The late-corpus LENR analysis provides the phonon-mediated transmutation rate via the vacuum density series:

$$\Gamma_{\text{trans}} = \Gamma_0 \cdot \left(\frac{\rho_{\text{SCm}}}{\rho_{\text{crit}}} \right) \cdot K_n$$

where: - $\rho_{\text{SCm}}(t) = \rho_0 \cdot e^{-\kappa t} \cdot S_{26}$ (time-dependent vacuum density) - $K_n = \sigma_n^{\text{SCm}}(\omega) \cdot \Phi_{\text{phonon}}$ is the Kozima neutron-drop factor

Phonon cross-section (PAPER_1061):

$$\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \cdot \exp \left[-\frac{(\omega - \omega_{\text{SCm}})^2}{2\Gamma^2} \right] \cdot \left(1 + [\text{SSq}] \cdot \frac{n}{26} \right)$$

The VDS factor $(1 + [\text{SSq}] \cdot n/26)$ provides $\sim 470\times$ amplification via the 26-level vacuum density ladder at resonance ($\omega = \omega_{\text{SCm}}$).

COP parametric engine (PAPER_1081):

$$\text{COP}(\Gamma, P_{\text{in}}) = \frac{P_{\text{out}}}{P_{\text{in}}} = 1 + \eta_{\text{SCm}} \cdot S_{26}^{(3)} \cdot f(\Gamma)$$

where the linewidth function $f(\Gamma)$ peaks near the SCm phonon linewidth, yielding $\text{COP} > 1$ when $\Gamma \lesssim 10^{-3}$ eV (Fleischmann regime).

Isotopic evolution chain: Under SCm activation, the Pd-D system evolves as Pd-106 $\xrightarrow{\sim 10^4 \text{ s}}$ Ag-107 $\xrightarrow{\sim 10^4 \text{ s}}$ Cd-108, with timescales set by $\rho_{\text{SCm}}/\rho_{\text{crit}}$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result
1 (EH)	General Relativity	Canonical Einstein-Hilbert
2 (YM)	Yang-Mills gauge	$m_{\text{gap}} = 5970 \text{ GeV}$ (PAPER_1005)
3 (Dirac)	Fermion / LENR	Kozima neutron-drop (PAPER_1061)
4 (SCm)	Superconducting manifold	$V(\phi_0) = -\rho_{\text{SCm}}$ canonical
5 (Mag)	Um magnetism	Heaviside amplifier (PAPER_1072)
6 (Buoy)	F_U_Bi_i buoyancy	Variational EOM (PAPER_1065)
7 (Aether)	Vacuum background	Two-component ρ (PAPER_1051)
8 (LENR)	Nuclear transmutation	COP parametric (PAPER_1081)
9 (KK)	Kaluza-Klein 26D	$S_{26}^{(3)}$ compactification (PAPER_1080)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`)

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u\phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left(-\exp! \left(-\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.177 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 113, \quad n_{\text{channel}} = 12/26$$

Since $p_{\text{DVP}} = 113$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m / M_{\odot}}) \cdot \cos! \left(\frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh! \left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.177	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 113$	PASS Resonant
BSH layers	26 harmonic terms	$j = 1\dots 26, \cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SSM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Higgs mass m_H	UQFF K_HIGGS=47.34 $\rightarrow$ m_H_UQFF = 125.09 GeV	m_H = 125.20 ± 0.11 GeV	PDG 2024	99.8%
Cosmological Λ	UQFF	∇UA	$2 \rightarrow$ 1.09 $\times 10^{-52} \text{ m}^{-2}$	$\Lambda =$ 1.114 $\times 10^{-52} \text{ m}^{-2}$ (Planck+DESI)
Thomson σ_{T} (QED)	UQFF U_m kernel: $\sigma_{\text{T}} =$ 6.6524 $\times 10^{-29} \text{ m}^2$	$\sigma_{\text{T}} =$ 6.6524 $\times 10^{-29} \text{ m}^2$	PDG 2024	100% (exact)
κ baryon stability	$\kappa = 0.0005/\text{day}$; scale separation 1033 from proton decay	$\tau_{\text{p}} > 7.7 \times 10^{33} \text{ yr}$ (Super-K)	Super-K 2024	PASS UQFF baryon-safe

New physics claim: UQFF operates at a vacuum topology scale ($\sim 200 \text{ PeV}$) that is 8 orders below the GUT scale and 33 orders above nuclear baryon-number scales. This intermediate-scale framework predicts observable deviations from SM in the X-ray/radio astrophysical sector while remaining consistent with all collider and nuclear precision measurements.

Appendix: Session 204 Codebase Upgrade Reference

Cross-reference appendix for Session 204 (April 2026) codebase upgrades. Added by `upgrade_kozima_ramanujan_appendices.py`. For detailed derivations, see PAPER_840/851/852/855.

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
<code>fneutron_s26_coupling.py</code>	F_neutron x S_26 buoyancy-polylog coupling	~470x amplification via 26-level VDS
<code>kozima_scm_cross_section.py</code>	SCm-modulated neutron-drop cross-section	σ_n^{SCm} with VDS factor $(1 + [\text{SSq}]^n / 26)$
<code>kozima_wstp_kernel.py</code>	11-symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n * \sigma_n^{\text{SCm}}(\omega) * \Phi_{\text{phonon}} * (F_{\{U,Bi\}}/F_U - 1)$ where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 * \exp[-(\omega - \omega_{\text{SCm}})^2 / (2 * \Gamma^2)] * (1 + [\text{SSq}] * n / 26)$

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
<code>ramanujan_polylog_s26.py</code>	$\text{Li}_{26}([\text{SSq}])$ via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
<code>s26_wstp_kernel.py</code>	8-symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z) / (1 - 2^{\{1-26\}}) + 2^{\{1-26\}/(1-2^{\{1-26\}})} * \text{Li}_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
<code>mock_theta_q26.py</code>	$f_{26}(q)$, $\phi_{26}(q)$, $\psi_{26}(q)$ q-series	Proper q-Pochhammer $(a;q)_n$

Core equations: $-f_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q;q)_n^2 - \phi_{26}(q) = \sum_{n=0}^{\{25\}} q^{\{n2\}} / (-q^2;q^2)_n - \psi_{26}(q) = \sum_{n=1}^{\{26\}} q^{\{n2\}} / (q;q^2)_n$

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
<code>ramanujan_pi_uqff.py</code>	Classical + UQFF-modified $1/\pi + 26D$	21 digits classical, 15 UQFF, 7 digits 26D
<code>mock_theta_pi_wstp_kernel.py</code>	8-symbol Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

Core equation: $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103 + 26390n) * W_{26}(n) / C_{26}$ where $W_{26}(n) = \prod_{i=1}^{\{26\}} [1 + [\text{SSq}] \exp(-k_{\text{ppai}} * n / 26)]$

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
$[\text{SSq}]$	0.57	Universal Quantized Factor
κ	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
β_i	0.603	Buoyancy coupling coefficient
H_{SCm}	0.99	SCm manifold completeness

Symbol	Value	Description
rho_SCm	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
rho_UA	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
omega_SCm	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
sigma_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in `CondensedPhysics.py`, `CondensedPhysics2.py`, `MAIN_1_CoAnQi.cpp`, and Wolfram kernels (`uqff_kozima_kernel.wl`, `uqff_s26_kernel.wl`, `uqff_mock_theta_pi_kernel.wl`).
