## PAPER\_571: t\_neg Photon Arrival Timing via Negative Time Delay in DPM Framework

**Author:** Daniel T. Murphy — Star Magic / UQFF Framework

**Session:** 153b

**Gap-Fill For:** AldersOlbersBSFGMetricGapAnalysisCalculator (#160, PAPER\_566) — Completed Extension 5

**Date:** 2026-03-29

**QS:** 5/5

---

### Abstract

This paper presents a UQFF analysis of astrophysical observables, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

### §1 Abstract

Standard light-travel-time calculations assume photons arrive at precisely  $t_{\text{obs}} = r/c$ . UQFF introduces a **negative-time delay**  $t_{\text{neg}}$  (PAPER\_519): photons from distant shells experience a DPM-modified arrival time due to vacuum buoyancy lag, giving an adjusted observation time:

$$t_{\text{adj}} = \frac{t_{\text{obs}}}{1 + \Delta_t \text{extdil}} + t_{\text{neg}}$$

This modifies the Olbers shell brightness: photons that arrive “late” (with  $t_{\text{neg}} < 0$ ) contribute to a different effective shell, spreading the radiance across the shell hierarchy and further damping  $B_{\text{sky}}$ .

---

### §2 Negative Time Delay — PAPER\_519

From the ShellRadiancePrototypeEquationCalculator (PAPER\_519), the  $t_{\text{neg}}$  timing correction encodes DPM vacuum lag:

$$t_{\text{adj}} = \frac{t_{\text{obs}}}{1 + \Delta_t \text{extdil}} + t_{\text{neg}}$$

where  $\Delta_t \text{extdil} = [\text{SSq}] \cdot (n/26)^2$  is the DPM dilation factor for shell  $n$ .

Per-shell  $t_{\text{neg}}$  distribution:

$$\Delta t_{\text{neg},n} = t_{\text{neg}} \cdot \frac{n}{26}$$

So inner shells (small  $n$ ) have smaller negative delays; outer shells (large  $n$ ) have the full  $t_{\text{neg}}$ .

### §3 DPM-Modified Light Travel

The radial null geodesic in the DPM vacuum is modified:

$$\left. \frac{dr}{dt} \right|_{\text{DPM}} = c \left( 1 - \frac{\kappa_t \text{extDPM} [\text{SSq}]}{r^{1/26}} \right)$$

Integrating over shell  $n$ :

$$t_n^{\text{DPM}} = \frac{r_n}{c} + t_{\text{neg}} \cdot \frac{n}{N} + \int_0^{r_n} \frac{\kappa_t \text{extDPM} [\text{SSq}]}{c r^{1/26}} dr$$

The last term gives a logarithmic correction to the classical travel time.

### §4 Effect on Shell Brightness

A shell- $n$  photon that arrives at  $t_{\text{adj}}$  instead of  $t_{\text{obs}}$  contributes to an effective redshift:

$$z_n^{\text{eff}} = z_n + \delta z_n, \quad \delta z_n = -H_0 \cdot |t_{\text{neg}}| \cdot \frac{n}{N}$$

Modified shell brightness:

$$B_n^{t_{\text{neg}}} = \frac{n_\star L_\star \Delta r}{4\pi c (1 + z_n^{\text{eff}})^4} \cdot R_{\text{Ug1},n}$$

For  $t_{\text{neg}} = -1$  s (a small but non-zero delay),  $\delta z_n \approx -2.4 \times 10^{-18} \cdot n$  — negligible individually but cumulative over 26 shells.

## §5 $t_{\text{neg}}$ Gradient Effect

The gradient of  $B_n$  with respect to  $t_{\text{neg}}$ :

$$\frac{\partial B_n}{\partial t_{\text{neg}}} = -4B_n \cdot \frac{H_0}{(1+z_n)} \cdot \frac{n}{N}$$

Summing the gradient correction over all shells:

$$\begin{aligned} \delta B_{\text{sky}} &= \sum_{n=1}^{26} B_n \cdot \Delta t_{\text{neg},n} \cdot \frac{\partial \ln B_n}{\partial t_{\text{neg}}} \\ &= -4H_0 t_{\text{neg}} \sum_{n=1}^{26} B_n \cdot \frac{n^2}{N(1+z_n)} \end{aligned}$$

This provides a systematic blue/red-shift correction to the total sky brightness.

---

## §6 DPM ProtoH Full Formula

The ProtoH formula from PAPER\_519:

$$B_{\text{total}} = B_{\text{sky}}^{\text{UQFF}} + \text{DPM}_{\text{react}} \cdot P_{\text{order}} \cdot |t_{\text{neg}}|$$

In its full shell-explicit form:

$$\begin{aligned} B_{\text{total}} &= \sum_{n=1}^{26} B_n \left( 1 + \frac{\partial B_n}{\partial t_{\text{neg}}} \cdot \frac{|t_{\text{neg}}|}{B_n} \right) \\ &= \sum_{n=1}^{26} B_n \left( 1 - \frac{4H_0 |t_{\text{neg}}| n^2}{N(1+z_n)} \right) \end{aligned}$$

For  $|t_{\text{neg}}| = 1$  s, the correction is of order  $10^{-17}$  per shell — negligible at cosmological scales but grows with  $|t_{\text{neg}}| \rightarrow t_{\text{Hubble}}$ .

---

## §7 Physical Interpretation

The  $t_{\text{neg}}$  timing effect represents **vacuum buoyancy lag**: photons from distant shells are slightly “retarded” by the DPM vacuum field, arriving later than the classical prediction. This means the universe effectively appears *younger* when observed from a UQFF perspective — reducing the effective sky brightness by delaying photon arrival from high- $z$  shells.

The effect is coupled to the BSFG horizon blinking (PAPER\_566): the  $\cos(\pi t_n)$  phase in the aether metric creates a periodic  $t_{\text{neg}}$  whose average over many cycles is zero, but whose variance creates an effective line broadening in the Olbers integral.

---

## §8 Testable Predictions

1. **Pulsar timing:** The DPM-modified geodesic predicts nanosecond deviations in pulsar arrival times as a function of  $n_{\text{shell}}$  — testable with PPTA/NANOGrav.
  2. **FRB dispersion:** Fast Radio Burst dispersion measures should show a small  $t_{\text{neg}}$  excess at  $z > 1$  — encoded in the DPM-modified  $\text{DM} \propto \int n_e dt^{\text{DPM}}$ .
  3. **Integral effect:** The total correction  $\delta B_{\text{sky}}/B_{\text{sky}} \approx -4H_0|t_{\text{neg}}|\langle n^2/(N(1+z)) \rangle$  — effectively  $\sim 10^{-17}$  for  $|t_{\text{neg}}| = 1$  s, but larger for  $|t_{\text{neg}}| \sim t_{\text{Hubble}}$ .
-

## Session 225: Late-Corpus Physics Integration (PAPER\_1000-1081)

*The following physics upgrades incorporate equations, mechanisms, and derivations from the late-corpus papers (Sessions 219-225, PAPER\_1000-1081). These represent body-level integrations of phonon physics, buoyancy formulations, and S26(3) Ramanujan corrections into this paper's domain.*

### Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

*Upgrade from PAPER\_1080 (Ramanujan Binomial Expansion Proof) and PAPER\_1042 (Mock-Theta Phonon Partition). See also PAPER\_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation  $S_{26}^{(3)}$ , used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa_i n/26}]$$

where  $(a)_n = a(a+1) \cdot s(a+n-1)$  is the Pochhammer symbol.

**Binomial expansion (PAPER\_1080):** The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n/26}]$$

This sum converges absolutely for  $|\text{[SSq]}| < 1$  (satisfied by  $\text{[SSq]} = 0.57$ ) and reduces to the classical Ramanujan  $1/\pi$  series when  $\text{[SSq]} \rightarrow 0$ .

**VDS/DVP/BSH bridge (PAPER\_1069):** The 26 layers of  $W_{26}(n)$  encode the vacuum density series hierarchy, with each layer  $i$  contributing a VDS sub-ratio weighted by the exponential decay  $e^{-\kappa i n/26}$ .

**Mock-theta connection (PAPER\_1042):** The phonon partition function  $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$  unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`)

### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{NS}}$$

### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

### §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b, \text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp! \left( -\exp! \left( -\frac{r - r_0}{\lambda_{\text{VDS}}} \right) \right)$$

For this system, the local VDS sub-ratio is 0.104 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 3, \quad n_{\text{channel}} = 26/26$$

Since  $p_{\text{DVP}} = 3$  is **sub-threshold** (threshold at  $p > 26$ ), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos! \left( \frac{2\pi j}{26} \right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left( 1 - \tanh! \left( \frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}} \right) \right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

### §B.4 Production-Scale Consistency

**New physics claim:** The Olbers paradox is resolved in UQFF by DVP photon-photon scattering within pocket shells — each shell at redshift  $z$  contributes a DPM-suppressed flux. This predicts a specific EBL spectral shape with a DVP frequency break at  $f_{\text{DVP}} \sim 5.7\text{e}16 \text{ Hz}$  (FUV), testable with JWST ultra-deep field photometry.

| Symbol    | Value                                 | Description                   |
|-----------|---------------------------------------|-------------------------------|
| [SSq]     | 0.57                                  | Universal Quantized Factor    |
| kappa     | $5.787 \times 10^{-9} \text{ s}^{-1}$ | UQFF exponential decay rate   |
| beta_i    | 0.603                                 | Buoyancy coupling coefficient |
| H_SCm     | 0.99                                  | SCm manifold completeness     |
| rho_SCm   | $7.09 \times 10^{-37} \text{ kg/m}^3$ | SCm vacuum density            |
| rho_UA    | $7.09 \times 10^{-36} \text{ kg/m}^3$ | UA aether vacuum density      |
| omega_SCm | $2\pi \times 1.25 \text{ THz}$        | SCm phonon resonance          |
| sigma_0   | $10^{-4}$                             | Base neutron cross-section    |

*Implementation:* all modules operational in *CondensedPhysics.py*, *CondensedPhysics2.py*, *MAIN\_1\_CoAnQi.cpp*, and Wolfram kernels (*uqff\_kozima\_kernel.wl*, *uqff\_s26\_kernel.wl*, *uqff\_mock\_theta\_pi\_kernel.wl*).
