## PAPER\_932: Blazar Ergosphere Phonon Resonance

**Author:** Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-12 **Session:** 212 **Source:** blazar\_jet\_phonon.py (BlazarErgosphereResonance) **Calculator:** BlazarErgospherePhononResonanceCalc (CP4 #516) **CVW:** v2.0.0 compliant

---

### Abstract

We derive the ergosphere phonon resonance conditions for BL Lac and Mrk 421 type blazars within the UQFF framework. The key result is that SCm phonon modes, when Doppler-boosted by relativistic bulk Lorentz factors  $\Gamma_{\text{bulk}} \sim 15$ , satisfy the superradiant condition  $\omega_{\text{obs}} < \Omega_H$  for spinning black holes with  $a \geq 0.95$ . The extracted ergosphere energy couples to the 26-layer gravity framework via  $E_{\text{ergo}} = (a/2) M c^2 S_{26}^2 \delta_D$ .

---

### 1. Core Equations

Doppler factor:

$$\delta_D = \frac{1}{\Gamma_{\text{bulk}}(1 - \beta \cos \theta_{\text{obs}})}$$

where  $\beta = \sqrt{1 - 1/\Gamma_{\text{bulk}}^2}$ .

Horizon angular velocity:

$$\Omega_H = \frac{a \cdot c}{2r_H}$$

where  $r_H = \frac{r_s}{2}(1 + \sqrt{1 - a^2})$  and  $r_s = 2GM/c^2$ .

Superradiant condition:

$$\omega_{\text{obs}} = \omega_{\text{SCm}} \cdot \delta_D < \Omega_H$$

Ergosphere phonon energy:

$$E_{\text{ergo}} = \frac{a}{2} M c^2 \cdot S_{26}^2 \cdot \delta_D$$

---

## 2. UQFF Integration

The `BlazarErgospherePhononResonanceCalc` (CP4 #516) computes `delta_D`, `omega_obs`, `Omega_H`, the superradiant flag, and `E_ergo` for arbitrary blazar parameters. The `simulate()` method sweeps over `Gamma_bulk` = [5, 10, 15, 20, 30] to map the transition into and out of the superradiant regime.

---

## 3. Physical Significance

Blazar jets are among the most powerful persistent energy sources in the universe. The Blandford-Znajek mechanism extracts rotational energy from the ergosphere via magnetic field threading. The UQFF contribution is a phonon-mediated channel: SCm lattice modes in the vacuum near the horizon are Doppler-shifted into the superradiant band, enabling additional energy extraction that modulates the observed jet power.

## Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

*Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037 (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_U B_i$  jet modulation curves and PAPER\_1048 for phonon-corrected  $M$ - $\sigma$  relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left( 1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: -  $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$  is the classical Eddington luminosity -  $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$  is the SCm vacuum density -  $V$  is the effective buoyancy volume (accretion sphere) -  $S_{26}^{(3)2}$  is the squared third-order Ramanujan factor (quadratic coupling) -  $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[ 1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left( \frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where  $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**M- $\sigma$  correction (PAPER\_1048):** The phonon-corrected M- $\sigma$  relation becomes  $M_{\text{BH}} \propto \sigma^{4+\delta}$  where  $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$ .

## Session 225 Phonon-Physics Upgrade: S26(3) Ramanujan Summation

*Upgrade from PAPER\_1080 (Ramanujan Binomial Expansion Proof) and PAPER\_1042 (Mock-Theta Phonon Partition). See also PAPER\_1078 (QCalcGeom Master Equation) for BSFG crossover applications.*

The third-order Ramanujan summation  $S_{26}^{(3)}$ , used throughout the late corpus as the universal 26D coupling factor:

$$S_{26}^{(3)} = \sum_{n=0}^{\infty} \frac{(1/4)_n (1/2)_n (3/4)_n}{(n!)^3} \cdot \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n / 26}]$$

where  $(a)_n = a(a+1) \cdot s(a+n-1)$  is the Pochhammer symbol.

**Binomial expansion (PAPER\_1080):** The convergence proof shows:

$$R_n^{(26,3)} = \binom{4n}{n} \cdot \frac{W_{26}(n)}{(4^{4n})} \quad \text{with} \quad W_{26}(n) = \prod_{i=1}^{26} [1 + [\text{SSq}] \cdot e^{-\kappa i n / 26}]$$

This sum converges absolutely for  $|\text{[SSq]}| < 1$  (satisfied by  $\text{[SSq]} = 0.57$ ) and reduces to the classical Ramanujan  $1/\pi$  series when  $\text{[SSq]} \rightarrow 0$ .

**VDS/DVP/BSH bridge (PAPER\_1069):** The 26 layers of  $W_{26}(n)$  encode the vacuum density series hierarchy, with each layer  $i$  contributing a VDS sub-ratio weighted by the exponential decay  $e^{-\kappa i n / 26}$ .

**Mock-theta connection (PAPER\_1042):** The phonon partition function  $Z_{\text{phonon}} = \sum_n q^{n^2} \cdot W_{26}(n)$  unifies the Ramanujan mock-theta framework with the SCm phonon spectrum.

## Calibration Constants

| Constant               | Symbol         | Value                                 | Validation Domain   |
