PAPER_990: F_U_Bi vs F_U_Bi_i Distinction

Abstract

We formalize the distinction between two complementary UQFF buoyancy quantities that are frequently confused:

Property	$F_{U,Bi}$	F_{U,Bi_i}
Direction	Inside $\rightarrow$ Outside	Outside $\rightarrow$ Inside (net)
Sign	Always positive	Typically negative
Units	Energy (J)	Acceleration (m/s ²)
Magnitude	$\sim 10^{40}$	$\sim 10^{-2}$
Physical meaning	Vacuum mass transport	Net gravitational acceleration

1. F_U_Bi (Inside-to-Outside)

$$F_{U,Bi} = \rho_{SCm} \cdot V \cdot S_{26}^2 \cdot \frac{|U_b|}{|U_g| + |U_b|}$$

This is the total vacuum energy flowing outward through the 26-layer buoyancy structure. It is always positive and cosmologically large because it includes $V_{\text{region}} \sim 10^{48} \text{ m}^3$.

2. F_U_Bi_i (Outside-to-Inside)

$$F_{U,Bi_i} = U_g + U_m + U_A - U_b + F_n \cdot S_{26} \cdot \Phi \cdot E_{\text{net}}$$

This is the per-particle net acceleration through the 6-layer canonical structure. Negative values indicate net inward pull (gravity dominates buoyancy at the acceleration level).

3. Complementarity

The ratio $|F_{U,Bi_i}|/F_{U,Bi}$ gives the fractional acceleration per unit vacuum energy — the “efficiency” of gravitational focusing through the buoyancy medium.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_U_Bi_i$ jet modulation curves and PAPER_1048 for phonon-corrected $M\text{-}\sigma$ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ kg/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Calibration Constants

Constant	Symbol	Value	Validation Domain
UQFF damping rate	κ	$5.0 \times 10^{-4} \text{ day}^{-1}$	Magnetar spin-down
String sector coupling	$[SSq]$	0.57	BH dynamics
Buoyancy coupling	β_i	0.603	Multi-system
SCm completeness	H_{SCm}	≈ 0.99	Heaviside threshold
SCm phonon frequency	ω_{SCm}	$2\pi \times 1.25 \text{ THz}$	Phonon resonance
SCm vacuum density	ρ_{SCm}	$7.09 \times 10^{-37} \text{ kg/m}^3$	Fundamental
