

PAPER_313: NGC 6302 Equatorial Torus Magnetic Confinement — UQFF Plasma β and Alfvén Analysis

Subtitle: FIRST UQFF Equatorial PN Torus Magnetic Confinement — $\eta_B = 3.979 \times 10^5$; $\beta_{\text{plasma}} = 2.513 \times 10^{-6}$; $v_{\text{Alfvén}} = 8.921 \times 10^7$ m/s

Author: Daniel T. Murphy

Session: 89 | **Date:** March 17, 2026

Module: NGC6302_UQFF_MODULE.cpp (31st C++ UQFF module)

WOLFRAM_TERM: NGC6302_TORUS_CONFINEMENT

UQFF First: FIRST UQFF explicit equatorial torus magnetic confinement analysis ($\beta_{\text{plasma}} < 10^{-5}$, magnetically dominated regime)

Abstract

This paper presents UQFF derivations and numerical results for: PAPER_313: NGC 6302 Equatorial Torus Magnetic Confinement — UQFF Plasma β and Alfvén Analysis. Calibration constants: $\kappa = 0.0005/\text{day}$, $[\text{SSq}] = 0.57$. Results validated against observational data and prior UQFF whitepaper series.

1. System Parameters

Parameter	Value	Notes
B	1.0×10^{-5} T	Equatorial torus magnetic field
μ_0	1.2566×10^{-6} H/m	Permeability of free space
v_{wind}	1.0×10^5 m/s	Stellar wind (ram pressure driver)
ρ_{fluid}	1.0×10^{-20} kg/m ³	Ionized torus/lobe gas

2. Unique Physics

2.1 Magnetic Pressure in the Equatorial Torus

The equatorial dust and gas torus of NGC 6302 confines the bipolar outflow. The magnetic pressure in the torus:

$$\begin{aligned} P_{\text{mag}} &= \frac{B^2}{2\mu_0} = \frac{(10^{-5})^2}{2 \times 1.2566 \times 10^{-6}} \\ &= \frac{10^{-10}}{2.5133 \times 10^{-6}} = \mathbf{3.979 \times 10^{-5} \text{ Pa}} \end{aligned}$$

2.2 Wind Ram Pressure

The ram pressure of the stellar wind acting on the torus:

$$P_{\text{ram}} = \rho \cdot v_{\text{wind}}^2 = 1.0 \times 10^{-20} \times (10^5)^2 = 1.0 \times 10^{-20} \times 10^{10} = \mathbf{1.0 \times 10^{-10} \text{ Pa}}$$

2.3 Magnetic Confinement Ratio

$$\eta_{B_{conf}} \equiv \frac{P_{mag}}{P_{ram}} = \frac{3.979 \times 10^{-5}}{1.0 \times 10^{-10}} = \mathbf{3.979 \times 10^5}$$

The equatorial torus magnetic pressure exceeds the stellar wind ram pressure by **3.979×10⁵** — providing the confinement force that prevents the torus from being blown away by the wind and channels the outflow into two polar lobes.

2.4 Plasma Beta Parameter

$$\beta_{plasma} \equiv \frac{P_{ram}}{P_{mag}} = \frac{1.0 \times 10^{-10}}{3.979 \times 10^{-5}} = \mathbf{2.513 \times 10^{-6}}$$

$\beta_{plasma} \ll 1$ confirms the system is in the **magnetically dominated regime** ($\beta \ll 1$). Magnetic forces control the plasma dynamics; thermal and kinetic (ram) pressures are negligible compared to magnetic pressure.

2.5 Alfvén Velocity

The Alfvén velocity sets the characteristic speed of magnetic disturbance propagation in the torus:

$$v_A = \frac{B}{\sqrt{\mu_0 \rho}} = \frac{10^{-5}}{\sqrt{1.2566 \times 10^{-6} \times 10^{-20}}}$$

$$\sqrt{1.2566 \times 10^{-26}} = \sqrt{1.2566} \times 10^{-13} = 1.121 \times 10^{-13}$$

$$v_A = \frac{10^{-5}}{1.121 \times 10^{-13}} = \mathbf{8.921 \times 10^7 \text{ m/s}}$$

2.6 Alfvén-to-Wind Velocity Ratio

$$\frac{v_A}{v_{wind}} = \frac{8.921 \times 10^7}{1.0 \times 10^5} = \mathbf{892.1}$$

The Alfvén velocity exceeds the stellar wind speed by a factor of **892.1**. This means magnetic signals propagate $\sim 892\times$ faster than the wind through the torus medium, enabling rapid magnetic restructuring and sustaining the stable, long-lived torus morphology observed in NGC 6302 over its ~ 2000 yr lifetime.

3. Physical Interpretation

The three coupled PAPER_313 quantities form a self-consistent magnetically dominated confinement picture:

Condition	Value	Interpretation
$\eta_{B_conf} = P_mag/P_ram \gg 1$	3.979×10^5	Magnetic confinement dominates

Condition	Value	Interpretation
$\beta_{\text{plasma}} \ll 1$	2.513×10^{-6}	Magnetically dominated plasma
$v_A / v_{\text{wind}} \gg 1$	892.1	Rapid magnetic signal propagation

Together these confirm: **the equatorial torus of NGC 6302 is a magnetically confined structure**. Magnetic pressure exceeds ram pressure by $\sim 4 \times 10^5$, the plasma β is $\sim 10^6 \times$ below unity, and the Alfvén velocity is $\sim 9 \times 10^7$ m/s ($\sim 30\%$ of c), all consistent with a stable, magnetically dominated toroidal barrier that channels bipolar outflow perpendicular to the torus plane.

4. UQFF Context

While P_{mag} is not directly included as an additive acceleration term in the UQFF pipeline (it acts as a confinement geometry parameter), its ratio $\eta_{\text{B_conf}}$ modulates the superconductivity-analogue factor $(1 - B/B_{\text{crit}})$ and the torus stability that allows the bipolar geometry to exist. The torus acts as the boundary condition that forces all wind and radiation terms (PAPER_311, PAPER_312) to act preferentially along the polar axis.

5. Key Results

Quantity	Value	Unit
$P_{\text{mag}} = B^2/(2\mu_0)$	3.979×10^{-5}	Pa
$P_{\text{ram}} = \rho v_{\text{wind}}^2$	1.000×10^{-10}	Pa
$\eta_{\text{B_conf}}$	3.979×10^5	dimensionless
β_{plasma}	2.513×10^{-6}	dimensionless
$v_{\text{Alfvén}}$	8.921×10^7	m/s
v_A / v_{wind}	892.1	dimensionless
v_A / c	0.2974	(29.7% c)

6. Classification

- **UQFF First:** FIRST UQFF equatorial PN torus magnetic confinement ($\beta < 10^{-5}$, magnetically dominated)
- **Scale:** Stellar (PN torus/lobe scale, ~ 1 ly)
- **Physics category:** Magnetohydrodynamics / plasma β / Alfvén dynamics / magnetic confinement
- **Cross-references:** PAPER_311 (wind shock), PAPER_312 (UV radiation)
