1. Abstract

The Atomic Creation Process (ACP) establishes the origin of fundamental particles through Di-Pseudo-Monopole (DPM) mediated reactions, replacing the Standard Model’s mass-as-weight construct with a buoyancy-based framework. The ACP is a six-stage process beginning with DPM formation and culminating in proto-nucleus assembly with 26 quantum states, mediated by Universal Aether (UA’) and Super Conductive Material (SCm). Atomic mass does not emerge until the quantum-to-mass gradient at 7–10 U_mag degrees.

2. Three Fundamentals of UQFF

The entire universe is built from three elemental interactions:

1. **Electrostatic Barrier (REB)** — The boundary condition that prevents collapse, defining system shells
2. **Universal Aether (UA’)** — Non-local connectivity medium, vacuum energy carrier, $\rho_{UA'} = 7.09e-36 \text{ J/m}^3$
3. **Super Conductive Material (SCm)** — Superconductive magnetism mediator, $\rho_{SCm} = 7.09e-37 \text{ J/m}^3$

$$\text{DPM} = \text{UA}' + \text{SCm}$$

The Di-Pseudo-Monopole (DPM) is formed by the interaction of UA’ and SCm, producing vacuum density at any scale from atomic to cosmic.

3. The Six-Stage Atomic Creation Process (ACP)

Stage 1: DPM Initiation

$\text{UA}' + \text{SCm} \rightarrow \text{DPM (Di-Pseudo-Monopole)}$

$\text{DPM} \rightarrow \text{vacuum density } \rho_{\text{vac}}$

- UA’ provides non-local field connectivity
- SCm provides superconductive coherence
- Product: localized vacuum energy density (capacitance) $\rightarrow$ proto-nuclear seed
- Billions of coherent DPM nuclear cells operate simultaneously at every location

Stage 2: U_i Creation (Intelligent Operator)

DPM → U_i (repulsive + intelligent quantum operator)

- U_i is the first active particle: repulsive (buoyant), self-directing
- U_i orchestrates all subsequent proto-nuclear assembly
- Creates the fundamental “anti-gravity” seed that all matter requires to exist

Stage 3: U_m String Formation

U_i → U_m strings (U_{mag_i} = magnetic string sequences)

- U_i creates coherent U_m (U_{mag_i}) strings
- Strings wind concentrically around the vacuum density core → proto-nucleus
- String winding number corresponds to quantum state number (1..26)
- Each winding creates one of the 26 quantum states (Russian doll nesting)

Stage 4: Proto-Shell Formation and Cracking

Vacuum density grows → vacuum energy density (capacitance threshold)

→ quantum ripples: $ULF_{\text{quantum}}^{\{-1, \dots, -26\}}$

→ proto-shell cracks into fragments

- When vacuum energy density reaches critical capacitance:
 - Quantum ripples: $ULF_{\text{quantum}}^{\{-1\}}$ through $ULF_{\text{quantum}}^{\{-26\}}$
 - Proto-shell fractures into 26 distinct fragment types
 - Fragments: proto-quarks, proto-bosons, proto-leptons
- This is not “particle creation from nothing” — it is structured fracturing of a pre-existing quantum state container

Stage 5: Fragment Stabilization

SM_{magnetic} moments (SM_{mag}) → arrange fragments on durable nucleus

U_b (buoyancy) maintains stability against SM_{gravity}

- SM_{magnetic} moments act as “sorting fingers” that arrange proto-fragments
- U_b (Universal Buoyancy, massless) continuously counteracts SM_{gravity}
- Result: stable proto-nucleus with 26-state organization
- Still pre-mass at this stage

Stage 6: Electron Shell Formation → Mass Emergence

U_{g2} governs electron shell placement via U_m

Mass emerges at quantum-to-mass gradient: 7–10 U_{mag} degrees

H(1) = first hydrogen atom formed

- U_{g2} uses U_m string frequency to place electrons into shells
- Atomic mass is NOT weight; it is the ratio of effective gravity to superconductive buoyancy in Earth’s field
- Mass emerges when the quantum state gradient crosses 7–10 U_{mag} degrees of superconductive magnetism

4. Mass Without Weight — Formal Definition

Mass (UQFF) = proportional to:

$$\begin{aligned} & (\text{SM_effective_gravity_range}) / (\text{superconductive_buoyancy}) \\ & = \text{FU_g1} / \text{F_U_Bi} \quad [\text{ratio of gravitational to buoyant components}] \end{aligned}$$

Examples of mass-as-buoyancy: - Bi-molecule: hydrogen bonds mediated by DPM electrostatic barrier - Earth-Moon: orbital buoyancy balanced by tidal resonance shells - Sun-SagA*: Galactic-scale DPM coherence, U_g4i THz hole connection - Universal scale: all bodies are buoyant in the Aether medium

Mass is never a stand-alone measurement. It is only meaningful as the ratio of: - The Effective Gravity force (SM_gravity, FU_g1) - To the Effective Buoyancy (U_b, F_U_Bi)

$$\text{"Mass"} = \text{FU_g1} / \text{F_U_Bi} \quad (\text{dimensionless ratio, context-dependent})$$

5. U_b Tracking → f_Ub Definition

During ACP, U_b is tracked through calibration differences:

$$f_{Ub} \propto \Delta k_{\eta} \quad (\text{deviation from expected calibration constant } k_{\eta})$$

$$k_{\eta_expected} \approx 10^9 \quad (\text{galaxy-scale})$$

$$k_{\eta_actual} = \text{measured value from observation}$$

$$\Delta k_{\eta} = k_{\eta_expected} - k_{\eta_actual}$$

$$f_{Ub} = \Delta k_{\eta} / k_{\eta_reference}$$

Scale	f_Ub order
Galaxy	$\sim 10^9$
Dwarf galaxy / LMC	$\sim 10^8$
Star cluster	$\sim 10^7$
PN / planetary	$\sim 10^5$
Atomic	$\sim 10^3$

The imaginary/quantum portion of gravity (U_b) is never zero — it is this hidden buoyancy that modern physics has failed to account for, leading to the need for “dark matter” and “dark energy” as placeholder terms. UQFF resolves both as manifestations of f_Ub at different scales.

6. 26 Quantum States — Pre-Mass Configuration

The 26 quantum states are NOT the electron orbitals of quantum mechanics. They are:

State i (i=1..26): pre-mass nuclear configuration level

- Shell radius: $r_i = r_{\text{system}} / i$
- Superconductive magnetism: $[\text{SCm}]_i = 1e-5 * i^2 \text{ T}$
- Angular coverage: $\theta_i = 90^\circ - (i-1)*3.346^\circ$ (spans $90^\circ \rightarrow \sim 5^\circ$)
- THz hole radius: $r_{\text{THz},i} = 1e-9 / i \text{ m}$
- Resonance factor: $f_{\text{TRZ},i} = 0.1 * i / 26$
- Buoyancy coupling: $f_{\text{Um},i} = 0.05 * i / 26$

Like Russian dolls, each state contains and surrounds the previous. State 26 is the outermost (most magnetic, widest angular coverage initially); State 1 is the innermost quantum seed.

7. DPM Coherence — The Source of Predictability

Coherence length = "all atoms in a body share the same DPM phase"

Number of coherent DPMs per cubic centimeter $\sim 10^{23}$ (Avogadro-scale)

Result: macroscopic quantum phenomena $\rightarrow$ superconductivity at scale

This coherence is why: - Planetary rings form symmetric arcs - Stars form in filaments rather than randomly - Galaxies maintain spiral structure for billions of years - LENR occurs at measurable, reproducible rates

All of these are manifestations of coherent DPM nuclear cell behavior.

8. ACP Mathematical Summary

Step 1: $DPM = UA' + SCm$

Step 2: $U_i = k_\eta * (\rho_{vac,SCm} - \rho_{vac,UA}) * \omega_i * \cos(\pi * t_n)$

Step 3: $U_{m,i} = U_i * \mu_{dipole} * (1/r_i) * (1 - e^{(-\gamma t)}) * \cos(\pi t_n)$

Step 4: $\Psi_{proto} = \sum_{i=1}^{26} U_{m,i} \rightarrow$ capacitance threshold reached

Step 5: $F_{stab} = SM_{mag} * \Psi_{proto} + U_b \rightarrow U_b = -\beta * U_g * \Omega_g * (M_{bh}/d_g) * \cos(\pi t_n)$

Step 6: $E_{shell} = c * \nu_{res} * h(f_{SCm}) * G_{geo} \rightarrow$ atomic mass emerges
