Title: Sagittarius A* SMBH Gravitational Field: 8-Term MUGE Decomposition and Quantum Coherence Peak at Horizon

Author: Daniel T. Murphy

Framework: UQFF/MUGE Star-Magic

Date: March 7, 2026

Source Data: validate_uqff_muge.py, from_system('SgrA'), $r_{\text{horizon}} = 1.27 \times 10^{10} \text{ m}$

Index Slot: §1.12 UQFF Master Calculators, Paper #92

Abstract

Sgr A*, the Milky Way SMBH at $4 \times 10^6 M_{\odot}$, serves as the primary calibration system for MUGE. Using validate_uqff_muge.py and system parameters from the from_system('SgrA') constructor, we compute the complete 8-term MUGE breakdown at $r_{\text{horizon}} = 1.27 \times 10^{10} \text{ m}$, confirm no NaN/Inf, identify the quantum coherence Gaussian peak at r_{horizon} , and quantify the $|\text{coherence at horizon}| \gg |\text{coherence at } r \gg r_{\text{horizon}}|$ separation.

1. Sgr A* System Parameters (from_system output)

Parameter	Value	Source
M_{BH}	$8.0 \times 10^6 \text{ kg}$ ($4.0 \times 10^6 M_{\odot}$)	EHT 2022, GRAVITY+
$r_{\text{Schwarzschild}}$	$1.19 \times 10^{10} \text{ m}$	$r_{\text{S}} = 2GM/c^2$
r_{horizon} (UQFF)	$1.27 \times 10^{10} \text{ m}$	$r_{\text{S}} \times (1 + [\text{SCm}] \times 0.07)$
d_{GC}	$2.55 \times 10^{20} \text{ m}$	27,000 ly
B_{corona}	$\sim 10^{14} \text{ T}$	EHT polarimetry
ρ_{corona}	$\sim 10^{21} \text{ kg/m}^3$	RIAF model
AGN A_AGN	1.0 (quiescent)	Monitoring 2020-2025

Note: $r_{\text{horizon}}^{\text{UQFF}} = 1.27 \times 10^{10} \text{ m} > r_{\text{S}} = 1.19 \times 10^{10} \text{ m}$ by $\sim 7\%$, arising from $[\text{SCm}] \sim 0.99$ superconductive horizon shift.

2. 8-Term MUGE Decomposition at r_{horizon}

From validate_uqff_muge.py:

Term	Value at r_{horizon} (m/s^2)	% of g_{total}
base_gravity (Newton)	234.1	99.82%
sum_Ug (Ug1+Ug2+Ug3+Ug4)	0.40	0.17%
U_i (UQFF integral)	0.015	0.006%
cosmological (?)	-5.8×10^{-26}	$-2.5 \times 10^{-6}\%$

Term	Value at r_{horizon} (m/s ²)	% of g_{total}
quantum (? correction)	$+3.1 \times 10^{-47}$	negligible
fluid (Navier-Stokes)	$+7.5 \times 10^{-1}$	negligible
dark_matter (DM halo)	+0.00061	0.00026%
coherence (Gaussian peak)	anomalously high	see below
sum = g_{total}	234.5 m/s²	100%

3. Quantum Coherence Term

Gaussian Envelope

The quantum coherence contribution uses a Gaussian peaked at r_{horizon} :

$$g_{\text{coh}}(r) = g_{\text{coh},0} \cdot \exp\left(-\frac{(r - r_{\text{horizon}})^2}{2\sigma_{\text{coh}}^2}\right)$$

$g_{\text{MUGE}}(r) = g_{\text{N}}(r) \left(1 - \frac{U_{\text{b}_i}}{F_{\text{U}}}\right) \left(1 + \frac{H_0}{r}\right)$, $\quad U_{\text{b}_i}/F_{\text{U}} \approx 2.85 \times 10^{-4}$ \$

$g_{\text{MUGE}}(r) = g_{\text{N}}(r) \left(1 - \frac{U_{\text{b}_i}}{F_{\text{U}}}\right) \left(1 + \frac{H_0}{r}\right)$, $\quad U_{\text{b}_i}/F_{\text{U}} \approx 2.85 \times 10^{-4}$ \$

$\text{NameL_text}\{\text{UQFF}\} = \frac{4\pi G M c}{\{\kappa_{\text{es}}\} \text{Bigl}(1 - [\text{SSq}] \cdot e^{-\{\kappa_{\Delta t}\} \text{Bigr})}$, $\quad [\text{SSq}] = 0.57 \text{Name}$

Where $s_{\text{coh}} \sim \text{Planck length} \times (M/m_{\text{P}})^{1/3}$.

Coherence Values

Location	r/r_{horizon}	g_{coh}	Ratio
At horizon	1.0	$g_{\text{coh},0}$	1.000
$2 \times \text{horizon}$	2.0	$g_{\text{coh},0} \times e^{-\text{very large}}$	~ 0
$106 \times r_{\text{horizon}}$	106	effectively 0	~ 0

coherence_at_horizon » **coherence_far** — by many orders of magnitude. This confirms the quantum coherence term only contributes near the horizon and falls off (essentially to machine epsilon) at distances » r_{horizon} .

From validator: `assert coh_at_horizon > coh_far * 1e6` — **PASS**.

4. MUGE vs Newton: Field Profile $r = r_{\text{horizon}} ? 10 \text{ kpc}$

r (m)	g_{Newton} (m/s ²)	g_{MUGE} (m/s ²)	? (%)
1.27×10^{10}	234.1	234.5	+0.17
1×10^{12}	2.18×10^{-2}	2.19×10^{-2}	+0.13
1×10^{15}	2.18×10^{-8}	2.18×10^{-8}	+0.04
1×10^{20}	2.18×10^{-18}	2.19×10^{-18}	+0.02
3×10^{20} (8.5 kpc)	2.42×10^{-1}	2.79×10^{-1}	+15.3 (DM)

At 8.5 kpc from Sgr A* (solar galactocentric radius), MUGE exceeds Newton by 15.3% due to dark matter halo term dominating. This is consistent with rotation curve flatness.

5. Coherence as Information Anchor

The quantum coherence Gaussian serves as an **information anchor** at the horizon: all infalling quantum states are coherently encoded in the superposition peak at `r_horizon`. This supports the 26D channel resolution (Paper #84): information is stored in the coherence peak of channels 25-26, not lost to thermal Hawking radiation.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **magnetar-field** sector of the 9-sector UQFF Lagrangian (see uqff_lagrangian_derivation.py).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_B)(\partial^\mu \phi_B) - V(\phi_B) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_B) = \frac{1}{2}m^2\phi_B^2 + \frac{\lambda}{4!}\phi_B^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_B$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_B} = \nabla \times (\rho_{\text{SCm}} \mathbf{v} \times \mathbf{B}) + \kappa B_{\text{crit}} \partial_t \phi_B = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_B =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.113 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 5, \quad n_{\text{channel}} = 15/26$$

Since $p_{\text{DVP}} = 5$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10^3 yr** (field decay quiescence):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
