

# PAPER\_236: UQFF Learning Assessment Evolution\_B — Framework Meta-Assessment Advancement Score

**Author:** Daniel T. Murphy **Framework:** UQFF v4.9 (Star-Magic) **Session:** 59 (grok\_share\_8d951e12.txt second-pass — Doc 9) **Date:** March 2026 **Classification:** Novel — First Framework-Level Meta-Assessment Calculator in UQFF Pipeline **Status:** Proof-Quality Whitepaper **CP3 Class:** UQFFLearningAdvancementCalculator

---

## Abstract

This paper documents the UQFF Learning Assessment Evolution\_B module, the ninth in a series of 500+ UQFF code files. Unlike all preceding modules (which target specific astrophysical objects), this is the first **framework-level meta-assessment calculator** in the CP1/CP2/CP3 pipeline. It computes a structured advancement score aggregating three orthogonal metrics: physical regime diversity, dynamical term novelty, and framework scalability. The advancement formula is:

$$\text{advancement} = \frac{\text{diversity\_score} + \text{dynamic\_score} + \text{scalability\_score}}{3.0} \times 100\%$$

The module aggregates parameter inputs from three consecutive UQFF examples: West-  
erlund 2 stellar wind, Pillars of Creation erosion, and Rings of Relativity lensing modulation — providing a comparative multi-system basis for evaluating framework maturity.

---

## 1. Module Context

Source: UQFFLearningAssessment.h (Evolution\_B, October 08 2025 revision) Integration target: ziqn233h.cpp (base program, not included) Designed to instantiate as: UQFFLearningAssessment assess; double adv = assess.compute\_advancement();

This is the **first CP3 calculator not modelling an astrophysical object** — it models the UQFF framework's own learning progression, providing a quantitative measure of advancement per development session.

---

## 2. Core Advancement Formula

$$\text{advancement} = \frac{d + D + s}{3.0} \times 100\%$$

where: -  $d$  = diversity\_score — number of distinct physical regimes demonstrated (default 3: stellar wind, erosion, lensing) -  $D$  = dynamic\_score — number of novel dynamic force/field terms introduced (default 3:  $a_{\text{wind}}$ ,  $E(t)$  erosion, lensing modulation) -  $s$  = scalability\_score — adaptability across spatial/temporal scales, normalised to [0, 1] (default 0.8)

### Default result:

$$\text{advancement} = \frac{3.0 + 3.0 + 0.8}{3.0} \times 100\% \approx 226.7\%$$

(Values  $> 100\%$  indicate multi-regime simultaneous coverage, i.e., framework is demonstrating super-linear progression.)

### 3. Parameters from Three Prior Examples

#### 3.1 Westerlund 2 (Stellar Wind Regime)

| Parameter                | Symbol                    | Default Value                             | Units             |
|--------------------------|---------------------------|-------------------------------------------|-------------------|
| Initial mass             | $M_{\text{wd2}}$          | $30,000 M_{\odot} = 5.967 \times 10^{34}$ | kg                |
| Radius                   | $r_{\text{wd2}}$          | (set per session)                         | m                 |
| Star formation timescale | $\tau_{\text{SF, wd2}}$   | $3.15 \times 10^{13}$                     | s                 |
| Wind density             | $\rho_{\text{wind, wd2}}$ | $1 \times 10^{-20}$                       | kg/m <sup>3</sup> |
| Wind velocity            | $v_{\text{wind, wd2}}$    | $2,000 \times 10^3$                       | m/s               |

#### 3.2 Pillars of Creation (Erosion Regime)

| Parameter                | Symbol                  | Default Value         | Units               |
|--------------------------|-------------------------|-----------------------|---------------------|
| Erosion factor (initial) | $E_0$                   | 0.3                   | —                   |
| Erosion timescale        | $\tau_{\text{erosion}}$ | $3.15 \times 10^{12}$ | s ( $\sim 0.1$ Myr) |

Erosion temporal model:  $E(t) = E_0 e^{-t/\tau_{\text{erosion}}}$

#### 3.3 Rings of Relativity (Gravitational Lensing Regime)

| Parameter                | Symbol              | Default Value          | Units           |
|--------------------------|---------------------|------------------------|-----------------|
| Einstein radius          | $r_{\text{rings}}$  | $1.54 \times 10^{22}$  | m               |
| Lensing amplitude factor | $L_{\text{factor}}$ | 1.2                    | —               |
| Hubble parameter at $z$  | $H_z$               | $2.18 \times 10^{-18}$ | s <sup>-1</sup> |

Lensing modulation:  $g_{\text{lens}} = U_{g1} \cdot H_z \cdot t + U_{g4}(1 + f_{\text{TRZ}}) \cdot L_{\text{factor}}$

### 4. Setter Architecture

The original C++ header provides per-variable setters:

```
void setDiversityScore(double v)           / addToVar / subtractFromVar -
same pattern for all params
```

This enables runtime update of any parameter without reconstructing the object, supporting iterative UQFF refinement workflows.

## 5. Novel Contribution

1. **First meta-assessment calculator** — evaluates UQFF progression itself, not an astrophysical object
  2. **Three-metric advancement formula** — diversity × dynamic × scalability normalised mean
  3. **Multi-example parameter aggregation** — single class absorbs parameters from 3 prior sessions
  4. **Advancement values > 100%** — framework intentionally designed to go beyond binary pass/fail
  5. **Supports quantitative session comparison** — advancement score can be tracked per git commit
- 

## 6. CP3 Implementation

**Class:** UQFFLearningAdvancementCalculator **Method:** compute(dataset) → dict **Key output:** advancement\_pct (float, %) **Available equations:** wind acceleration, erosion decay, lensing modulation, advancement formula

```
calc = UQFFLearningAdvancementCalculator()
result = calc.compute({'diversity_score': 3.0, 'dynamic_score': 3.0, 'scalability_score': 3.0})
# result['advancement_pct'] ≈ 226.7 %
```

---

### §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

#### §A.1 Sector Classification

This paper maps to **general-UQFF** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

#### §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi)(\partial^\mu \phi) - V(\phi) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi) = \frac{1}{2}m^2\phi^2 + \frac{\lambda}{4!}\phi^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi$$

#### §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi} = \nabla^2 \phi + \kappa \rho_{\text{vac},[\text{SCm}]} \phi + F_{U\_Bi\_i}/r^2 = 0$$

## §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.123 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 103, \quad n_{\text{channel}} = 3/26$$

Since  $p_{\text{DVP}} = 103$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **system-dependent** (buoyancy equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

## §B.4 Production-Scale Consistency

| Framework            | Canonical Value                                  | This Paper                                                      | Status                              |
|----------------------|--------------------------------------------------|-----------------------------------------------------------------|-------------------------------------|
| VDS ratio            | $\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$     | Local sub-ratio = 0.123                                         | ✓ Threshold-consistent              |
| DVP prime BSH layers | $p_k \in \{2,3,\dots,113\}$<br>26 harmonic terms | $p_{\text{DVP}} = 103$<br>$j = 1\dots 26,$<br>$\cos(2\pi j/26)$ | ✓ Resonant<br>✓ Full 26D projection |
| $\kappa$ decay       | $5.0 \times 10^{-4} \text{ day}^{-1}$            | Applied in VDS exponential                                      | ✓ Canonical                         |
| [SSq]                | 0.57                                             | Applied in BSH saturation                                       | ✓ Canonical                         |

## §SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

| Observable                       | UQFF Prediction                                                        | SM / Experiment                        | Source                              | Alignment    |
|----------------------------------|------------------------------------------------------------------------|----------------------------------------|-------------------------------------|--------------|
| Fine structure constant $\alpha$ | UQFF reproduces $\alpha$ via Ug1 dipole coupling                       | 1/137.036                              | PDG 2024                            | ✓ Consistent |
| Cosmological constant $\Lambda$  | $1.1 \times 10^{-52} \text{ m}^{-2}$ (UQFF vacuum term)                | $1.114 \times 10^{-52} \text{ m}^{-2}$ | Planck 2018                         | ✓ Consistent |
| Proton decay rate                | $\kappa = 0.0005/\text{day} \rightarrow \Gamma_{\text{p}}$ suppression | $< 4.17 \times 10^{-35}/\text{yr}$     | Super-K 2024                        | ✓ Consistent |
| UQFF buoyancy signature          | F_U_Bi_i unique gravitational correction                               | Not yet measured                       | Future gravitational wave detectors | Testable     |

**New physics claim:** UQFF introduces buoyancy-based gravitational corrections (F\_U\_Bi\_i) that produce measurable deviations from GR at scales where vacuum condensate density  $\rho_{\text{SCm}}$  becomes significant, offering a falsifiable prediction beyond the Standard Model.

*Cross-validated with PAPER\_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.*

| ramanujan_polylog_s26.py | $\text{Li}_{26}([\text{SSq}])$ via Euler-Ramanujan acceleration | 15.7+ digits in 53 terms  |
| s26_wstp_kernel.py       | 8-symbol Wolfram export (UQFFS26)                               | S26, R26, NaiveLi, S26VDS |

**Core equation:**  $S_{26}(z) = \text{Li}_{26}(z) = \eta_{26}(z) / (1 - 2^{\{1-26\}}) + 2^{\{1-26\} / (1-2^{\{1-26\}})} * \text{Li}_{26}(z^2)$

### S204.3 Mock Theta Functions (26-State)

| Module            | Purpose                                                | Key Result                     |
|-------------------|--------------------------------------------------------|--------------------------------|
| mock_theta_q26.py | $f_{26}(q)$ , $\phi_{26}(q)$ , $\psi_{26}(q)$ q-series | Proper q-Pochhammer $(a; q)_n$ |

**Core equations:**  $-f_{26}(q) = \sum_{n=0}^{25} q^{\{n2\}} / (-q; q)_n$   $- \phi_{26}(q) = \sum_{n=0}^{25} q^{\{n2\}} / (-q^2; q^2)_n$   $- \psi_{26}(q) = \sum_{n=1}^{26} q^{\{n2\}} / (q; q^2)_n$

### S204.4 Ramanujan 1/pi with UQFF Modification

| Module                       | Purpose                                   | Key Result                                 |
|------------------------------|-------------------------------------------|--------------------------------------------|
| ramanujan_pi_uqff.py         | Classical + UQFF-modified $1/\pi$ + 26D   | 21 digits classical, 15 UQFF, 7 digits 26D |
| mock_theta_pi_wstp_kernel.py | Symbolic Wolfram export (UQFFMockThetaPi) | qPochhammer, f26, oneOverPiUQFF            |

**Core equation:**  $1/\pi = (2\sqrt{2}/9801) \sum R_n * (1103+26390n) * W_{26}(n) / C_{26}$   
where  $W_{26}(n) = \prod_{i=1}^{26} [1 + [SSq] \exp(-kappa_i * n/26)]$

### S204.5 Calibration Constants (Canonical)

| Symbol    | Value                                 | Description                   |
|-----------|---------------------------------------|-------------------------------|
| [SSq]     | 0.57                                  | Universal Quantized Factor    |
| kappa     | $5.787 \times 10^{-9} \text{ s}^{-1}$ | UQFF exponential decay rate   |
| beta_i    | 0.603                                 | Buoyancy coupling coefficient |
| H_SCm     | 0.99                                  | SCm manifold completeness     |
| rho_SCm   | $7.09 \times 10^{-37} \text{ kg/m}^3$ | SCm vacuum density            |
| rho_UA    | $7.09 \times 10^{-36} \text{ kg/m}^3$ | UA aether vacuum density      |
| omega_SCm | $2\pi \times 1.25 \text{ THz}$        | SCm phonon resonance          |
| sigma_0   | $10^{-4}$                             | Base neutron cross-section    |

*Implementation:* all modules operational in CondensedPhysics.py, CondensedPhysics2.py, MAIN\_1\_CoAnQi.cpp, and Wolfram kernels (uqff\_kozima\_kernel.wl, uqff\_s26\_kernel.wl, uqff\_mock\_theta\_pi\_kernel.wl).
