Abstract

$$F_{U,Bi} = \kappa \cdot \frac{\rho_{SCm}}{\rho_{UA}} \cdot (U_{g1} + U_{g2} + U_{g3} + U_{g4} + U_m + U_{bi})$$

This paper presents a UQFF analysis of compute_a_wormhole() Implementation & MUGE Safety Infrastructure, deriving compressed field equations and observational predictions within the Star-Magic/UQFF framework.

1. Overview

This paper captures the formal C++ implementation of the wormhole coupling term in the Resonance MUGE framework, along with division-by-zero error safety in the Compressed MUGE functions, a complete 24-test assertion suite, and full CSV I/O for MUGESystem data. These form the production-ready computational layer for the UQFF framework.

2. compute_a_wormhole() — Implemented Function

Canonical Form

```
double compute_a_wormhole(double r, double b = 1.0,
                          double f_worm = 1.0,
                          double Evac_neb = 7.09e-36) {
    return f_worm * Evac_neb * (1.0 / (b * b + r * r));
}
```

Physical Meaning

$$a_{\text{worm}} = f_{\text{worm}} \cdot \text{Evac_neb} / (b^2 + r^2)$$

- $b = 1.0 \text{ m}$ — Morris-Thorne throat radius (PAPER_373 baseline)
- $f_{\text{worm}} = 1.0$ — wormhole coupling constant (dimensionless, unit default)
- $\text{Evac_neb} = 7.09 \times 10^{-36} \text{ J/m}^3$ — nebular vacuum energy density
- Denominator $(b^2 + r^2)$ — wormhole geometry: $r \rightarrow 0$ gives throat maximum, $r \rightarrow \infty \rightarrow 0$

Numerical values:

At $r = 1e4 \text{ m}$, $b = 1.0$: $a_{\text{worm}} = 7.09e-36 / (1 + 1e8) \approx 7.09e-44 \text{ m/s}^2$

At $r = 1e12 \text{ m}$, $b = 1.0$: $a_{\text{worm}} = 7.09e-36 / 1e24 = 7.09e-60 \text{ m/s}^2$

At $r = 0.0 \text{ m}$, $b = 1.0$: $a_{\text{worm}} = 7.09e-36 / 1.0 = 7.09e-36 \text{ m/s}^2$ (throat max)

Integration into compute_resonance_MUGE()

```
double compute_resonance_MUGE(const MUGESystem& sys, const ResonanceParams& res) {
    double aDPM          = compute_aDPM(sys, res);
    double aTHz           = compute_aTHz(aDPM, sys, res);
    double avac_diff      = compute_avac_diff(aDPM, sys, res);
    double asuper_freq    = compute_asuper_freq(aDPM, res);
    double aaether_res     = compute_aaether_res(aDPM, res);
    double Ug4i           = compute_Ug4i(aDPM, sys, res);
    double aquantum_freq  = compute_aquantum_freq(aDPM, res);
    double aAether_freq   = compute_aAether_freq(aDPM, res);
    double afluid_freq    = compute_afluid_freq(sys, res);
    double Osc_term       = compute_Osc_term();
    double aexp_freq      = compute_aexp_freq(aDPM, sys, res);
    double fTRZ           = compute_fTRZ(res);
    double a_worm         = compute_a_wormhole(sys.r); // ← NEW final term

    return aDPM + aTHz + avac_diff + asuper_freq + aaether_res
        + Ug4i + aquantum_freq + aAether_freq + afluid_freq
        + Osc_term + aexp_freq + fTRZ + a_worm; // 13 total terms
}
```

3. Error-Safe Compressed MUGE Functions

Division-by-zero protection added to 4 compressed MUGE functions:

```
double compute_compressed_base(const MUGESystem& sys) {
    if (sys.r == 0.0)
        throw std::runtime_error("Division by zero in r");
    return G * sys.M / (sys.r * sys.r);
}

double compute_compressed_super_adj(const MUGESystem& sys) {
    if (sys.Bcrit == 0.0)
        throw std::runtime_error("Division by zero in Bcrit");
    return 1 - sys.B / sys.Bcrit;
}

double compute_compressed_quantum(double hbar, double Delta_x_p, ...) {
    if (Delta_x_p == 0.0)
        throw std::runtime_error("Division by zero in Delta_x_p");
    return (hbar / Delta_x_p) * integral_psi * (2 * PI / tHubble);
}

double compute_compressed_perturbation(const MUGESystem& sys) {
    if (sys.r == 0.0)
        throw std::runtime_error("Division by zero in r^3");
    return (sys.M + sys.M_DM) * (sys.delta_rho_rho + 3*G*sys.M / (sys.r*sys.r*sys.r));
}
```

8. Key Numerical Reference (Wormhole term across 7 systems)

Sagittarius A*	1e12	7.09e-36 / 1e24 $\approx$ 7.09e-60
Tapestry of Blazing Starbirth	3.086e17	7.09e-36 / 9.52e34 $\approx$ 7.44e-71
Westerlund 2	3.086e17	same as Tapestry
Pillars of Creation	9.46e15	7.09e-36 / 8.95e31 $\approx$ 7.92e-68
Rings of Relativity	3.086e17	7.09e-36 / 9.52e34 $\approx$ 7.44e-71
Student's Guide	1e26	7.09e-36 / 1e52 $\approx$ 7.09e-88

The wormhole term is always subdominant ($\ll$ other MUGE terms), confirming it acts as a geometrically-grounded perturbation rather than a dominant contribution.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **wormhole-metric** sector of the 9-sector UQFF Lagrangian (see uqff_lagrangian_derivation.py).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{WH}})(\partial^\mu \phi_{\text{WH}}) - V(\phi_{\text{WH}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{WH}}) = \frac{1}{2}m^2\phi_{\text{WH}}^2 + \frac{\lambda}{4!}\phi_{\text{WH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{WH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{WH}}} = R_{\mu\nu} + \Phi'(r)/r - b(r)/(r^2(1 - b/r)) + 8\pi G\rho_{\text{vac},[\text{SCm}]} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{WH}} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.057 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 61, \quad n_{\text{channel}} = 14/26$$

Since $p_{\text{DVP}} = 61$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **throat crossing time** (geodesic stabilization):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
