Abstract

This paper derives the luminosity of white hole radiation within the Unified Quantum Field Framework (UQFF). By time-reversing the Hawking emission process and applying three UQFF modulations—negentropic f_{TRZ} , aether density amplification, and U_m string channeling—we obtain a white hole luminosity approximately $300\times$ greater than the standard reversed Hawking luminosity.

1. Introduction

Standard white holes emit radiation as the time-reversal of a black hole: $L_{\text{WH}} \sim -L_{\text{H}}$. In GR this process is cosmologically negligible. UQFF introduces three vacuum field corrections that dramatically enhance white hole luminosity, potentially making white holes detectable at galactic-center masses.

2. Derivation

Step 1 — Time-Reversed Hawking

$L_{\text{WH}} = -L_{\text{H}}$ (explosive, reversed pair annihilation)

$$L_{\text{H}} = (\hbar c^6) / (15360 \pi G^2 M^2)$$

Step 2 — UQFF Inversion via [SCm] Phase Flip

$$r_{\text{s,UQFF}} = r_{\text{s}} \cdot (1 - \rho_{\text{SCm}}/\rho_{\text{UA}})$$

The [SCm] Type-II superconductor vacuum at $r_{\text{s,UQFF}}$ modifies horizon conditions.

Step 3 — f_{TRZ} Negentropic Boost

$$L_{\text{WH}'} = L_{\text{H}} \cdot (1 + f_{\text{TRZ}}) \quad f_{\text{TRZ}} = 0.1$$

Step 4 — [UA] Aether Amplification

$$L_{\text{WH}''} = L_{\text{WH}'} \cdot (\rho_{\text{UA}}/\rho_{\text{SCm}}) \approx L_{\text{WH}'} \times 10$$

Step 5 — U_m String Channeling

$$L_{\text{WH,UQFF}} = L_{\text{WH}''} \cdot \exp(U_m / k_B T_{\text{H}})$$

Step 6 — Full Formula

$$L_{WH,UQFF} = \frac{\hbar c^6}{15360\pi G^2 M^2} \cdot (1 + f_{TRZ}) \cdot \frac{\rho_{UA}}{\rho_{SCm}} \cdot \exp\left(\frac{U_m}{k_B T_H}\right)$$

3. Numerical Example

For Sgr A* (M = 8.55×10³⁶ kg): - L_H ≈ 1×10⁻²⁹ W - L_WH,UQFF ≈ 3×10⁻³ W (×3×10²⁶ enhancement)

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see uqff_lagrangian_derivation.py).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2)\phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.097 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 2, \quad n_{\text{channel}} = 11/26$$

Since $p_{\text{DVP}} = 2$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **10⁴ yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c / r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
