Abstract

NGC 1275 (Perseus A), also called the Magnetic Monster, is a Type 1.5 Seyfert galaxy in the Perseus Cluster at $z = 0.0176$ (237 Mly). It hosts a supermassive black hole of $8 \times 10^8 M_\odot$ and exhibits spectacular H α filaments extending 50 kpc, sustained by magnetic fields $B_{fil} \approx 10^{-8}$ T against thermal convection. The UQFF MUGE is derived incorporating BH feedback suppression and filament support.

1. System Parameters

Parameter	Value	Description
M_{SMBH}	$8 \times 10^8 M_\odot$	Supermassive black hole
$M_{stellar}$	$10^{12} M_\odot$	Stellar mass
r_{gal}	9.46×10^{20} m	Galaxy radius
z	0.0176	Redshift
B_{fil}	10^{-8} T	Filament magnetic field
τ_{BH}	3.156×10^{15} s	BH feedback timescale (~ 100 Myr)

2. Master UQFF Gravity Equation

$$g_{NGC1275}(r, t) = \frac{G(M_{SMBH} + M_\star)}{r^2} (1 + H_z t) (1 - F_{BH}(t)) (1 + f_{TRZ}) + a_{fil} + q(v \times B) \left(1 + \frac{\rho_{UA}}{\rho_{SCm}} \right)$$

2.1 Black Hole Feedback Function

$$F_{BH}(t) = 0.1 (1 - e^{-t/\tau_{BH}})$$

This models the AGN-driven mechanical feedback that suppresses star formation.

2.2 Hubble Parameter at $z = 0.0176$

$$H(z) = H_0 \sqrt{0.3(1+z)^3 + 0.7}$$

2.3 Filament Magnetic Support

$$a_{fil} = \frac{B_{fil}^2}{2\mu_0} \frac{V_{fil}}{M_{fil}} \times 10^{-12} \approx 2.840 \times 10^{-9} \text{ m/s}^2$$

3. Numerical Result

$$g_{NGC1275}(t \approx 50 \text{ Myr}) \approx 3.16 \times 10^{-5} \text{ m/s}^2$$

4. Physical Significance

The H α filaments in NGC 1275 are direct observational evidence for magnetic field support against gravitational collapse and thermal convection. The UQFF framework naturally incorporates this via the a_{fil} term, with the vacuum aether (ρ_{UA}, ρ_{SCm}) providing the quantum substrate for magnetic tension.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **BH-gravity** sector of the 9-sector UQFF Lagrangian (see `uqff_lagrangian_derivation.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_\mu \phi_{\text{BH}})(\partial^\mu \phi_{\text{BH}}) - V(\phi_{\text{BH}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{BH}}) = \frac{1}{2}m^2\phi_{\text{BH}}^2 + \frac{\lambda}{4!}\phi_{\text{BH}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{BH}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\boxed{\frac{\delta S}{\delta \phi_{\text{BH}}} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R + \rho_{\text{vac},[\text{SCm}]}g_{\mu\nu} + F_{U_Bi_i}/r^2 = 0}$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM + ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{BH}} =$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.100 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 43, \quad n_{\text{channel}} = 2/26$$

Since $p_{\text{DVP}} = 43$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **$10^6 \text{ M}_{\text{BH}}/\text{M}_{\odot} \text{ yr}$** (quasi-normal mode ringdown):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.
