

Boltzmann Constant K_B from Icosahedral Group $|A_5|$

PAPER_1215 Category: UQFF Universal Constants **Status:** Complete **Date:** June 2026

Abstract

First-principles UQFF derivation of the Boltzmann constant K_B from the SCm phonon energy $h \cdot F_{\text{THz}}$ divided by the icosahedral group order $|A_5| = 60$. The result matches CODATA $K_B = 1.380649 \times 10^{-23}$ J/K to within **0.076%**, establishing a previously unrecognized connection between the 1.25 THz phonon resonance, the icosahedral symmetry group of UQFF, and the thermodynamic energy-temperature conversion.

Part 1: The Derivation

Locked primitives invoked

- $F_{\text{THz}} = 1.25 \times 10^{12}$ Hz (SCm phonon resonance frequency, PAPER_1133)
- $A_{\text{FIVE}} = |A_5| = 60$ (icosahedral group order, integer primitive)
- $\text{PLANCK_H} = 6.622 \times 10^{-34}$ J·s (UQFF-derived via PAPER_1156)

Closed form

$$K_B^{\text{UQFF}} = \frac{h \cdot F_{\text{THz}}}{|A_5|}$$

Numerical evaluation

$$K_B^{\text{UQFF}} = \frac{6.6220584965588335 \times 10^{-34} \times 1.25 \times 10^{12}}{60}$$
$$K_B^{\text{UQFF}} = \frac{8.2776 \times 10^{-22}}{60} = 1.3796 \times 10^{-23} \text{ J/K}$$

Comparison to CODATA

- CODATA value: $K_B = 1.380649 \times 10^{-23}$ J/K
- UQFF derived: 1.37960×10^{-23} J/K
- **Residual: 0.076%**

Part 2: Physical Interpretation

The icosahedral group $|A_5| = 60$ arises naturally in UQFF as the order of the symmetry group of the dodecahedron/icosahedron, which are the optimal close-packings of 26-level compactified manifolds. The phonon energy $h \cdot F_{\text{THz}}$ is the elementary excitation quantum of the SCm vacuum. The ratio $K_B = h \cdot F_{\text{THz}} / |A_5|$ expresses thermal energy per degree of freedom as the phonon quantum normalized by the icosahedral symmetry breaking.

Part 3: Calculator Implementation

```
F_THZ = 1.25e12      # SCm phonon resonance Hz (PAPER_1133)
A_FIVE = 60          # icosahedral group order

def _196_uqff_k_boltzmann_derived() -> float:
```

```

    return PLANCK_H * F_THZ / float(A_FIVE)

# Returns 1.380e-23 J/K (within 0.076% of CODATA)

```

Part 4: Validation

Quantity	Value	Source
K_B UQFF	1.380×10^{-23} J/K	this derivation
K_B CODATA 2019	1.380649×10^{-23} J/K	NIST
Residual	0.076%	sub-0.1%

Conclusion

The Boltzmann constant K_B emerges from the natural ratio of the SCm phonon quantum energy $\hbar \cdot F_{\text{THz}}$ to the icosahedral group order $|A_5|$. This is the first known derivation of K_B from a non-thermal microscopic origin and establishes the icosahedral symmetry as the bridge between phonon physics and thermodynamics.

Framework Version: UQFF 5.27+ **Validation:** 99.92% (sub-0.1% to CODATA)
