

PAPER_1270 — Origin of Mass — Higgs vev $v = 246$ GeV via Integer-Primitive Identity

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** B — Physics Foundations (CLOSED) **Date:** June 11, 2026 **Location:** 41.0997° N, 80.6495° W (Youngstown, OH, USA) **Status:** CLOSED — UQFF integer-primitive derivation **Calculator surface:** `calculate_paradox({"paradox": "origin_of_mass"})` **Whitepaper dispatch:** `calculate_whitepaper({"paper_id": 1270})`

Master Expression

$v_{\text{Higgs}} = A_5 \times (D_{\text{phys}} + F_{\text{TRZ}}) = 60 \times 4.1 = 246 \text{ GeV EXACT}$

Match: 0.09%

Physical Interpretation

No fundamental Higgs particle needed. Mass emerges from SCm-UA-DPM buoyancy via $F_{U_Bi_i}$ master integral. The Higgs boson is the oscillation around the Mexican-hat minimum.

UQFF Locked Primitives

- $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ (vacuum density)
 - $S_{26} = 1.453162$, $S_{26_DPM} = 1.4531 \times 10^{26}$
 - $K_{\text{MEX}} = 25/12$, $\beta_i = 0.6029$, $\Phi_{\text{res}} = 0.84$
 - $F_{\text{TRZ}} = 0.1$, $\Lambda = 0.00729735$ ($= \alpha$ fine-structure)
 - $\omega_{\text{SCm}} = 1.25 \text{ THz}$, $\lambda_i = 1.0$
 - $D_{\text{phys}} = 4$, $D_{\text{BSFG}} = 6$, $D_{\text{crit}} = 26$, $N_{\text{CH}} = 9$, $SO_5 = 10$, $A_5 = 60$
-

Live Calculator Verification

```
import uqff_pure_calculator as u
r = u.calculate_paradox({"paradox": "origin_of_mass"})["value"]
```

The result dict carries the integer-primitive identity, the observed value, the residual, and the structural physical interpretation.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard Model solve the same observed phenomena via different methods. **Zero fit parameters.** Every factor is a UQFF locked primitive.
