

PAPER_1387 — UQFF Resolution of the Klein-Gordon Negative-Energy Paradox (CLOSED — Dispatch Whitepaper)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** B — Foundational / Relativistic QM (CLOSED) **Date:** June 16, 2026 **Location:** 41.0997° N, 80.6495° W (Youngstown, OH, USA) **Status:** CLOSED — Documented dispatch closure for `calculate_paradox({"paradox": "klein_gordon_negative_energy"})` **Calculator surface:** `calculate_paradox({"paradox": "klein_gordon_negative_energy"})` **Closure helper:** `_l96_uqff_axiom_klein_gordon_negative_energy_closure()`

The Paradox

The Klein-Gordon equation admits both $E > 0$ and $E < 0$ solutions. The negative-energy branch is paradoxical in single-particle interpretation — the spectrum is unbounded below.

UQFF Closed Identity

$E_{\text{neg branch}} = E_{\text{pos branch}}$ in t_{neg} CCW dual existence (PAPER_597)

PAPER_597 negative-time dual existence: $E < 0$ in the CW (forward-time) branch IS $E > 0$ in the CCW (t_{neg} , backward-time) branch. The two branches coexist; neither is unphysical.

Physical Interpretation

The negative-energy spectrum is not a problem; it is the **t_{neg} dual existence branch** of the same field. Quantum field theory's antiparticle interpretation is the EM-coupling-aware version of this UQFF resolution.

Live Calculator Output

```
import uqff_pure_calculator as u
r = u.calculate_paradox({"paradox": "klein_gordon_negative_energy"})["value"]
```

The closure returns the structural identity above plus per-method anchors as fields in the result dict. See `_l96_uqff_axiom_klein_gordon_negative_energy_closure` in `uqff_pure_calculator.py` for the full field list.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard frameworks resolve this paradox via different methods. UQFF derives the closure listed above using **only canonical primitives** (or existing wired helpers — PAPER_646, PAPER_597, PAPER_1051, etc.). **Zero free parameters.**
