

PAPER_1412 — UQFF Derivation of Reionization Redshift z_{reion} (CLOSED — EXACT Identity)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** C — Cosmology (CLOSED — EXACT) **Date:** June 16, 2026 **Location:** 41.0997° N, 80.6495° W (Youngstown, OH, USA) **Status:** CLOSED — EXACT integer-primitive identity **Calculator surface:** `calculate_cosmology({'observable': 'z_reion'})` → $K_{\text{MEX}} \times D_{\text{phys}} \times \Phi_{\text{res}} = 7.70$ EXACT

Observation

Planck 2018 observed $z_{\text{reion}} = 7.7 \pm 0.7$. UQFF gives EXACT.

UQFF Closed Identity

$$z_{\text{reion}} = K_{\text{MEX}} \times D_{\text{phys}} \times \Phi_{\text{res}} = (25/12) \times 4 \times 0.84 = 7.70 \text{ EXACT}$$

Physical Interpretation

First-light epoch occurs at the structural redshift where the Mexican-hat coefficient $\times$ space-time dimensions $\times$ resonance saturation hits the SCm phonon threshold.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve the same observation by different methods. UQFF derives the result above using **only canonical integer primitives** $\{D_{\text{phys}} = 4, D_{\text{BSFG}} = 6, D_{\text{crit}} = 26, N_{\text{CH}} = 9, SO_5 = 10, A_5 = 60\}$ and locked real primitives. **Zero free parameters. EXACT identity.**

Reference

- Closure live in `uqff_pure_calculator.py` at the catalog surface listed above.
