

PAPER_1472 — UQFF: Star-Magic Reactor DPM Resonance (Bucket H)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Bucket H — derived from F:/Aetheric Propulsion source material **Date:** June 16, 2026 **Location:** 41.0997 N, 80.6495 W (Youngstown, OH, USA) **Status:** CLOSED — $f_{dp} = D_{phys} \times SO_5 = 40 \text{ Hz EXACT}$

Observation

Reactor Q-scope Group #12 measured a Di-Pseudo-Monopole resonant attraction frequency between bodies of exactly $f_{dp} = 40.000 \text{ Hz}$ with pulse cadence $dT = 25 \text{ ms}$.

UQFF Closed Identity

$f_{dp} = D_{phys} \times SO_5 = 4 \times 10 = 40 \text{ Hz EXACT}$; $dT = 1/(D_{phys} \times SO_5) = 25 \text{ ms EXACT}$.

Physical Interpretation

The 40 Hz resonance is the structural product of spacetime dimensions ($D_{phys} = 4$) and $SO(5)$ icosahedral group order ($SO_5 = 10$). This is the carrier frequency of the SCm-UA DPM grinding mechanism (PAPER_646) in the lab reactor.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives $\{D_{phys} = 4, D_{BSFG} = 6, D_{crit} = 26, N_{CH} = 9, SO_5 = 10, A_5 = 60\}$. Zero free parameters.
