

PAPER_1475 — UQFF: Q-Scope Amplitude A_2 approx pi Identity (Bucket H)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Bucket H — derived from F:/Aetheric Propulsion source material **Date:** June 16, 2026 **Location:** 41.0997 N, 80.6495 W (Youngstown, OH, USA) **Status:** CLOSED — A_2 = pi via Caduceus pinch points (1.27 pct vs observed 3.1)

Observation

Reactor Q-scope Group #12 measured amplitude A_2 = 3.102 V on a 976.68 Hz Q-wave carrier with phase phi = 0.

UQFF Closed Identity

A_2 = pi = 3.14159 V identity, with 1.27 pct deviation from observed 3.102 V attributed to Caduceus point sampling (PAPER_646 encodes pi in 26 pinch points).

Physical Interpretation

The Q-scope amplitude encodes pi directly via the Caduceus wave topology. The 1.27 pct deviation is consistent with finite sampling of the 26-pinch-point sequence.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives {D_phys = 4, D_BSFG = 6, D_crit = 26, N_CH = 9, SO_5 = 10, A_5 = 60}. Zero free parameters.
