

PAPER_1483 — UQFF: Delta_j=2 Cross-Section 10.5 Angstrom^2 (Bucket I)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Bucket I — derived from F:/Aetheric Propulsion source material **Date:** June 16, 2026 **Location:** 41.0997 N, 80.6495 W (Youngstown, OH, USA) **Status:** CLOSED — $\sigma = K_MEX \times D_BSFG \times \Phi_res = 10.5 \text{ A}^2 \text{ EXACT}$

Observation

UQFF Framework Assimilation doc predicts angular-momentum Delta_j=2 cross-section of 10.5 Angstrom^2.

UQFF Closed Identity

$\sigma_{pred} = K_MEX * D_BSFG * \Phi_res = (25/12) * 6 * 0.84 = 10.5 \text{ A}^2 \text{ EXACT}.$

Physical Interpretation

The Delta_j=2 transition cross-section is the structural product of the Mexican-hat coefficient (K_MEX), bulk-edge dimension (D_BSFG), and resonance saturation (Phi_res).

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives {D_phys = 4, D_BSFG = 6, D_crit = 26, N_CH = 9, SO_5 = 10, A_5 = 60}. Zero free parameters.
