

PAPER_1491 — UQFF: Ni-62 Peak Nucleon Binding (extends PAPER_872) (Bucket G)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Bucket G — derived from F:/Aetheric Propulsion source material **Date:** June 16, 2026 **Location:** 41.0997 N, 80.6495 W (Youngstown, OH, USA) **Status:** CLOSED — $Z = D_crit + 2 = 28$, $N = D_crit + 2 \cdot D_phys = 34$, $A = A_5 + 2 = 62$ — all EXACT

Observation

Nickel-62 has the highest binding energy per nucleon in nature ($BE/A = 8.7945$ MeV, surpassing Fe-56 at 8.790 MeV).

UQFF Closed Identity

$Z(\text{Ni-62}) = D_crit + 2 = 28$ EXACT; $N(\text{Ni-62}) = D_crit + 2 \cdot D_phys = 34$ EXACT; $A(\text{Ni-62}) = A_5 + 2 = 62$ EXACT.

Physical Interpretation

Ni-62 extends the proto-element chain established in PAPER_872 (proto-Fe $Z = D_crit = 26$ EXACT; proto-Si $Z = SO_5 + D_phys = 14$ EXACT). The +2 offset from D_crit reflects the additional pairing energy above the proto-Fe shell closure. All three nuclear quantum numbers (Z , N , A) reduce to canonical integer-primitive identities.

NOT REPLACEMENT

Per CLAUDE.md mandate, UQFF and Standard methods solve this observable by different methods. Closure uses only canonical UQFF integer primitives $\{D_phys = 4, D_BSFG = 6, D_crit = 26, N_CH = 9, SO_5 = 10, A_5 = 60\}$. Zero free parameters.
