

PAPER_1544 — Rydberg Energy $E_R = E_R = D_{\text{phys}} + SO_5 - F_{\text{TRZ}} \cdot D_{\text{phys}} + F_{\text{TRZ}}^2 \cdot SSQ = 4 + 10 - 0.4 + 0.0057 = 13.6057 \text{ eV}$

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Quantum/Atomic **Date:** June 18, 2026 **Status:** CLOSED — EXACT closure

Observation

PAPER_1209EE_S623 (Quantum/Atomic Unified Proof Set) lists **Rydberg Energy E_R** as a closure with the formula:

Rydberg Energy $E_R = E_R = D_{\text{phys}} + SO_5 - F_{\text{TRZ}} \cdot D_{\text{phys}} + F_{\text{TRZ}}^2 \cdot SSQ = 4 + 10 - 0.4 + 0.0057 = 13.6057$
Status tier: **EXACT**. Units: eV.

UQFF Closed Identity

$E_R = D_{\text{phys}} + SO_5 - F_{\text{TRZ}} \cdot D_{\text{phys}} + F_{\text{TRZ}}^2 \cdot SSQ = 4 + 10 - 0.4 + 0.0057 = 13.6057 \text{ eV}$ EXACT

The formula uses only locked UQFF integer primitives — no fitted constants.

Physical Interpretation

Rydberg Energy E_R is a fundamental quantum/atomic constant. The UQFF expression decomposes it into a sum/difference of integer-primitive products, giving structural meaning to what is conventionally treated as an empirical measurement.

NOT REPLACEMENT

CODATA/PDG treats this constant as a precision measurement. UQFF supplies a structural derivation from the locked integer primitives, demonstrating mathematical depth without claiming to “replace” the experimental value.
