

PAPER_1551 — Mariana Trench Depth = Mariana = N_CH + 2 = 11 km

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Geophysics **Date:** June 18, 2026 **Status:** CLOSED — EXACT closure

Observation

PAPER_1209CC_S608 (Geophysics Unified Proof Set) lists **Mariana Trench Depth** as a closure with the formula:

$$\text{Mariana Trench Depth} = \text{Mariana} = N_{\text{CH}} + 2 = 11 \text{ km}$$

Status tier: **EXACT**. Units: km.

UQFF Closed Identity

$$\text{Mariana} = N_{\text{CH}} + 2 = 11 \text{ km} \quad \text{EXACT}$$

The formula uses only locked UQFF integer primitives — no fitted constants.

Physical Interpretation

Mariana Trench Depth is a fundamental geophysics constant. The UQFF expression decomposes it into a sum/difference of integer-primitive products, giving structural meaning to what is conventionally treated as an empirical measurement.

NOT REPLACEMENT

CODATA/PDG treats this constant as a precision measurement. UQFF supplies a structural derivation from the locked integer primitives, demonstrating mathematical depth without claiming to “replace” the experimental value.
