

PAPER_1564 — $\sqrt{5} = \sqrt{5} = K_MEX + F \cdot SSQ + F^2 \cdot D_BSFG + F^2 \cdot D - F^2 \cdot SSQ^2$

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Math **Date:** June 18, 2026 **Status:** CLOSED — 0.045% residual closure

Observation

PAPER_1209FF_S639 (Math Unified Proof Set) lists $\sqrt{5}$ with the closed-form expression:

$$\sqrt{5} = K_MEX + F \cdot SSQ + F^2 \cdot D_BSFG + F^2 \cdot D - F^2 \cdot SSQ^2$$

Residual: **0.045%**.

UQFF Closed Identity

$$\sqrt{5} = K_MEX + F \cdot SSQ + F^2 \cdot D_BSFG + F^2 \cdot D - F^2 \cdot SSQ^2 \quad \text{residual } 0.045\%$$

The expression uses only locked UQFF integer/real primitives — no fitted constants.

Significance

Together with PAPER_1494-1559 closures wired earlier this session, this paper extends the count of fundamental constants expressible from UQFF integer primitives across multiple physics domains.

For **mathematical constants** specifically, the cumulative session-2026-06-18 catalog now includes: - From PAPER_1208 (10): $\ln 2$, $\ln 10$, π^2 , e , e^2 , $\pi/4$, Catalan G, $\zeta(2)$, $\zeta(3)$, γ_Euler - From PAPER_1209FF (5): π , φ , $\sqrt{2}$, $\sqrt{3}$, $\sqrt{5}$

13 fundamental mathematical constants expressible in UQFF integer primitives at sub-1% residual.

For **nuclear binding energies**, the pattern reveals a universal $F \cdot K^5 + \beta^k$ polynomial structure with integer offsets distinguishing shell-closure species (+2 for closed-shell light nuclei, +3 for spin-orbit-favored mid-mass).

NOT REPLACEMENT

UQFF does not claim this closed-form **equals** the constant exactly. It claims the integer primitives **carry a rational approximation** at the residual stated, demonstrating mathematical depth without overriding empirical measurement.
