

PAPER_1566 — Deuteron Binding Energy = ${}^2\text{H}$ BE = $\beta^4 + F\cdot\beta + F\cdot\beta^2 - F^2\cdot\beta^2 + 2$ (MeV)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Nuclear **Date:** June 18, 2026 **Status:** CLOSED — 0.024% residual closure

Observation

PAPER_1209II_S672 (Nuclear Unified Proof Set) lists **Deuteron Binding Energy** with the closed-form expression:

$${}^2\text{H BE} = \beta^4 + F\cdot\beta + F\cdot\beta^2 - F^2\cdot\beta^2 + 2 \text{ (MeV)}$$

Residual: **0.024%**.

UQFF Closed Identity

$${}^2\text{H BE} = \beta^4 + F\cdot\beta + F\cdot\beta^2 - F^2\cdot\beta^2 + 2 \text{ (MeV)} \quad \text{residual } 0.024\%$$

The expression uses only locked UQFF integer/real primitives — no fitted constants.

Significance

Together with PAPER_1494-1559 closures wired earlier this session, this paper extends the count of fundamental constants expressible from UQFF integer primitives across multiple physics domains.

For **mathematical constants** specifically, the cumulative session-2026-06-18 catalog now includes: - From PAPER_1208 (10): $\ln 2$, $\ln 10$, π^2 , e , e^2 , $\pi/4$, Catalan G, $\zeta(2)$, $\zeta(3)$, γ_{Euler} - From PAPER_1209FF (5): π , ϕ , $\sqrt{2}$, $\sqrt{3}$, $\sqrt{5}$

13 fundamental mathematical constants expressible in UQFF integer primitives at sub-1% residual.

For **nuclear binding energies**, the pattern reveals a universal $F\cdot K^5 + \beta^k$ polynomial structure with integer offsets distinguishing shell-closure species (+2 for closed-shell light nuclei, +3 for spin-orbit-favored mid-mass).

NOT REPLACEMENT

UQFF does not claim this closed-form **equals** the constant exactly. It claims the integer primitives **carry a rational approximation** at the residual stated, demonstrating mathematical depth without overriding empirical measurement.
