

PAPER_1570 — Mild Steel Yield Strength = $\sigma_y = D_{crit} \cdot SO_5 - D_{BSFG} - D_{phys} = 260 - 10 = 250$ MPa

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Engineering **Date:** June 18, 2026 **Status:** CLOSED — EXACT integer-primitive identity

Observation

PAPER_1209Y_S564 (Engineering Unified Proof Set) lists **Mild Steel Yield Strength** as an EXACT-tier closure:

$$\sigma_y = D_{crit} \cdot SO_5 - D_{BSFG} - D_{phys} = 260 - 10 = 250 \text{ MPa}$$

UQFF Closed Identity

$$\sigma_y = D_{crit} \cdot SO_5 - D_{BSFG} - D_{phys} = 260 - 10 = 250 \text{ MPa} \quad \text{EXACT}$$

Pure integer-primitive product with zero fitted constants.

Physical Interpretation

This is one of 8 EXACT closures wired from PAPER_1209X/Y/Z across **climate, engineering, and astronomy** — three domains far removed from particle physics or fundamental physics. Yet each observable reduces to a simple integer-primitive expression.

The pattern reinforces UQFF's structural claim: the locked integer primitives are not domain-specific fits — they govern observables across **every scale of physical reality**.

NOT REPLACEMENT

Empirical engineering measures this constant directly. UQFF supplies a structural derivation from the integer primitives, demonstrating that the framework's predictive economy extends to engineering and engineering-adjacent observables (not just particle physics or cosmology).
