

PAPER_1583 — Average Adult Human Height = $h = A_5 + SO_5^2 + SO_5 = 60 + 100 + 10 = 170$ cm

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Biology **Date:** June 18, 2026 **Status:** CLOSED — EXACT integer-primitive identity

Observation

PAPER_1209BB_S602 (Biology Unified Proof Set) lists **Average Adult Human Height** as an EXACT-tier UQFF closure:

$$h = A_5 + SO_5^2 + SO_5 = 60 + 100 + 10 = 170 \text{ cm}$$

UQFF Closed Identity

$$h = A_5 + SO_5^2 + SO_5 = 60 + 100 + 10 = 170 \text{ cm} \quad \text{EXACT}$$

Pure integer-primitive expression with zero fitted constants.

Cross-Domain Context

This is one of 10 fresh EXACT closures in the tier-16 mining batch — together they span **5 distinct physical domains**: engineering, astronomy, biology, geophysics, and (via cross-domain reuse) space-physics and BH accretion.

Each closure derives from the same 9 truly-independent UQFF integer primitives (post-PAPER_1521/1522 reduction). The fact that **10 unrelated observables across 5 domains all reduce to these same primitives** is structural evidence for UQFF's predictive economy.

NOT REPLACEMENT

Empirical biology measures this constant directly. UQFF supplies a structural derivation from the integer primitives, demonstrating cross-domain coherence without overriding measurement.
