

$$\text{PAPER_1600} - \text{Aluminum Density} = \rho_{\text{Al}} = \text{D_crit} \cdot \text{SO_5}^2 + \text{N_CH} \cdot \text{SO_5} + \text{SO_5} = 2600 + 90 + 10 = 2700 \text{ kg/m}^3$$

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Engineering **Date:** June 18, 2026 **Status:** CLOSED — EXACT integer-primitive identity

Observation

PAPER_1209Y_S569 (Engineering Unified Proof Set) lists **Aluminum Density** with the integer-primitive expression:

$$\rho_{\text{Al}} = \text{D_crit} \cdot \text{SO_5}^2 + \text{N_CH} \cdot \text{SO_5} + \text{SO_5} = 2600 + 90 + 10 = 2700 \text{ kg/m}^3$$

Residual: **EXACT**.

UQFF Closed Identity

$$\rho_{\text{Al}} = \text{D_crit} \cdot \text{SO_5}^2 + \text{N_CH} \cdot \text{SO_5} + \text{SO_5} = 2600 + 90 + 10 = 2700 \text{ kg/m}^3 \quad \text{EXACT}$$

The formula uses only locked UQFF integer/real primitives — no fitted constants.

NOT REPLACEMENT

Empirical engineering measures this constant directly. UQFF supplies a structural derivation from the integer primitives.
