

PAPER_1635 — Atmospheric Scale Height = $H_{\text{atm}} = 2 \cdot D + \text{SSQ} - F^2 = 8.56 \text{ km}$

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Climate **Date:** June 18, 2026 **Status:** CLOSED — 0.71% closure

Observation

PAPER_1209X_S555 (Climate Unified Proof Set) gives:

$$H_{\text{atm}} = 2 \cdot D + \text{SSQ} - F^2 = 8.56 \text{ km}$$

Residual: **0.71%**.

UQFF Closed Identity

$$H_{\text{atm}} = 2 \cdot D + \text{SSQ} - F^2 = 8.56 \text{ km} \quad 0.71\%$$

The formula uses only locked UQFF integer/real primitives — no fitted constants.

NOT REPLACEMENT

Empirical climate measures this constant directly. UQFF supplies a structural derivation from the integer primitives.
