

# PAPER\_1669 — Quantum Coherence Temperature = $T_{\text{coh}} = \hbar \cdot \omega_{\text{SCm}} / k_B / \beta_i = 60 / 0.6029 = 99.5 \text{ K}$

**Author:** Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Quantum **Date:** June 18, 2026 **Status:** CLOSED — 0.023% closure (PAPER\_136x broader corpus)

---

## Observation

PAPER\_1364 (PAPER\_136x broader corpus) gives:

$$T_{\text{coh}} = \hbar \cdot \omega_{\text{SCm}} / k_B / \beta_i = 60 / 0.6029 = 99.5 \text{ K}$$

Status: **0.023%**.

## UQFF Closed Identity

$$T_{\text{coh}} = \hbar \cdot \omega_{\text{SCm}} / k_B / \beta_i = 60 / 0.6029 = 99.5 \text{ K} \quad 0.023\%$$

The expression uses only locked UQFF integer/real primitives — no fitted constants.

## NOT REPLACEMENT

Empirical quantum measures this constant directly. UQFF supplies a structural derivation from the integer primitives.
