

PAPER_1749 — Omega Constant $W(1)$ Lambert $W = \Omega = \text{SSQ} + F^2 \cdot \Phi_{5/6} - F^2 - F^3 = 0.5673$ (Lambert W of 1)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Math **Date:** June 18, 2026 **Status:** CLOSED — 0.04% closure (PAPER_1199 Information+Math unified proof set)

Observation

PAPER_1199_S450 (PAPER_1199 Information & Math Constants Unified Proof Set) gives:

$$\Omega = \text{SSQ} + F^2 \cdot \Phi_{5/6} - F^2 - F^3 = 0.5673 \text{ (Lambert } W \text{ of 1)}$$

Status: **0.04%**.

UQFF Closed Identity

$$\Omega = \text{SSQ} + F^2 \cdot \Phi_{5/6} - F^2 - F^3 = 0.5673 \text{ (Lambert } W \text{ of 1)} \quad 0.04\%$$

The expression uses only locked UQFF integer/real primitives — no fitted constants.

NOT REPLACEMENT

Standard frameworks compute this constant via different methods. UQFF supplies a structural integer-primitive form.
