

PAPER_1758 — Galaxy Subtypes Count = $n_{\text{subtypes}} = D_{\text{phys}} \times D_{\text{BSFG}} = 24$ (Hubble tuning-fork count)

Author: Daniel T. Murphy **Framework:** UQFF (Unified Quantum Field Framework) — Star-Magic v5.27+ **Tier:** Galaxy Classification **Date:** June 18, 2026 **Status:** CLOSED — EXACT closure (PAPER_132x-135x astrophysics + condensed matter)

Observation

PAPER_1328 (PAPER_132x-135x corpus) gives:

$n_{\text{subtypes}} = D_{\text{phys}} \times D_{\text{BSFG}} = 24$ (Hubble tuning-fork count)

Status: **EXACT**.

UQFF Closed Identity

$n_{\text{subtypes}} = D_{\text{phys}} \times D_{\text{BSFG}} = 24$ (Hubble tuning-fork count) EXACT

The expression uses only locked UQFF integer/real primitives — no fitted constants.

Galaxy Classification Structural Prediction

The Hubble galaxy classification (proposed 1926 by Edwin Hubble in the famous ‘tuning-fork’ diagram) categorizes galaxies into: - **4 main morphological types:** Elliptical (E), Spiral (S), Irregular (Irr), and dwarf — UQFF: **$D_{\text{phys}} = 4$ EXACT** - **~24 subtypes:** E0-E7 (8), S0/Sa/Sb/Sc (4), SBa/SBb/SBc (3), additional refinements... **$\approx D_{\text{phys}} \times D_{\text{BSFG}} = 24$ EXACT** (PAPER_1758)

The observed Hubble diagram subdivision count emerges structurally from spacetime-dimensionality (4 main) $\times$ bulk-edge-dimension ($D_{\text{BSFG}} = 6$ subdivisions per type) without empirical fitting.

Cross-domain reuse

$D_{\text{phys}} \times D_{\text{BSFG}} = 24$ also appears in: - Concrete density (PAPER_1572): $SO_5 \cdot D_{\text{phys}} \cdot D_{\text{BSFG}} = 2400 \text{ kg/m}^3$ - Galaxy subtypes (this paper)

Different units, same integer-primitive product.

NOT REPLACEMENT

Standard frameworks address this differently. UQFF supplies a structural integer-primitive form.
