### Abstract

This paper presents UQFF derivations and numerical results for: PAPER\_289: Cooper-DPM Dual-Frequency SC Synthesis —  $\hbar \times f_{\text{super}} \times f_{\text{DPM}}$  Triple-Mode Quantum Product ( $A_{\text{sc}} = 6.994 \times 10^{21}$ ). Calibration constants:  $\kappa = 0.0005/\text{day}$ ,  $[\text{SSq}] = 0.57$ . Results validated against observational data and prior UQFF whitepaper series.

### 1. Discovery Statement

The UQFF SC-frequency term couples **Cooper pair quantum energy** ( $\hbar \times f_{\text{super}}$ ) to DPM resonance through the plasmotic vacuum, creating a **triple-mode quantum product**:

$$a_{\text{sc\_freq}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}} \cdot a_{\text{DPM}}}{E_{\text{vac}} \cdot c}$$

with SC amplification factor:

$$A_{\text{sc}} = \frac{\hbar \cdot f_{\text{super}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = 6.994 \times 10^{21}$$

The **full UQFF Resonance-SC** corrects all resonance modes by the Meissner factor:

$$g_{\text{res\_sc}}(t, B) = a_{\text{res\_total}} \cdot \underbrace{\left(1 - \frac{B}{B_{\text{crit}}}\right)}_{\text{SCm}} \cdot (1 + f_{\text{TRZ}})$$

At  $B \rightarrow B_{\text{crit}}$ : SCm  $\rightarrow 0$  — the **UQFF Resonance-Channel Meissner Gravity Quench**.

This is the **first UQFF module** applying the Meissner quench to a *pure resonance channel* (previous PAPER\_266 HUDF applied it to the full gravity sum of a galactic module).

## 2. Physical Equations

### 2.1 Cooper Pair Quantum Energy

$$E_{\text{Cooper}} = \hbar \cdot f_{\text{super}} = 1.0546 \times 10^{-34} \times 1.411 \times 10^{16}$$

$$E_{\text{Cooper}} = 1.488 \times 10^{-18} \text{ J} = 9.29 \text{ eV}$$

This energy sits at the extreme-UV / near-X-ray boundary, corresponding to the Cooper pair pairing energy at the magnetar critical field  $B_{\text{crit}} = 1011 \text{ T}$  frequency scale.

### 2.2 SC Amplification Factor

$$A_{\text{sc}} = \frac{E_{\text{Cooper}} \cdot f_{\text{DPM}}}{E_{\text{vac}} \cdot c} = \frac{1.488 \times 10^{-18} \times 10^{12}}{7.09 \times 10^{-36} \times 3 \times 10^8}$$

$$A_{\text{sc}} = \frac{1.488 \times 10^{-6}}{2.127 \times 10^{-28}} = 6.994 \times 10^{21}$$

The three coupled modes are: 1. **Cooper pair** at  $f_{\text{super}} = 1.411 \times 10^{16} \text{ Hz}$  ( $UV - \text{energysuperconductor frequency}$ ) 2.  $* DPM \text{resonance} * \text{at } f_{DPM} = 1 \times 10^{12} \text{ Hz}$  ( $THz \text{plasma dipole mode}$ ) 3.  $* Plasmotic vacuum * E_{vac} = 7.09 \times 10^{-36} \text{ J/m}^3$  (vacuum energy normalization)

### 2.3 SC Frequency Acceleration

$$a_{\text{sc\_freq}} = A_{\text{sc}} \times a_{\text{DPM}} = 6.994 \times 10^{21} \times 3.545 \times 10^{-18}$$

$$a_{\text{sc\_freq}} \approx 2.479 \times 10^4 \text{ m/s}^2$$

This large value is physically modulated by the Meissner correction at high B fields.

## 3. Meissner Gravity Quench

### 3.1 SC Correction

$$\text{SCm} = 1 - \frac{B}{B_{\text{crit}}}$$

| B (T)                        | B/B_crit                           | SCm                         | $g_{\text{res\_sc}} / a_{\text{res}}$                                       |
|------------------------------|------------------------------------|-----------------------------|-----------------------------------------------------------------------------|
| $1 \times 10^{-5}$           | $1.0   1.10   1 \times 10^7$       | $(\text{newton starcrust})$ | $1 \times 10^{-5}$                                                          |
| $5 (ISM)   1 \times 10^{-4}$ | $0.9999   1.10   5 \times 10^{10}$ | $(\text{nearmagnetar})$     | $0.5   0.5   0.55   9 \times 10^{10}   0.9   0.1   0.11   1 \times 10^{11}$ |
| 16                           | $= B_{\text{crit}}$                |                             |                                                                             |

### 3.2 Time-Reversal Amplification

At all fields, the  $(1 + f_{\text{TRZ}}) = 1.1$  factor ( $f_{\text{TRZ}} = 0.1$ ) adds a 10% time-reversal enhancement. At  $B = 0$ :  $g_{\text{res\_sc}} = 1.1 \times a_{\text{res\_total}}$  (maximum resonance contribution).

### 3.3 Resonance-Channel Meissner Quench

The UQFF Resonance-Channel Meissner Quench differs from PAPER\_266 (HUDF galactic Meissner) in:

| Feature           | PAPER_266 (HUDF)                   | PAPER_289 (RSC)                     |
|-------------------|------------------------------------|-------------------------------------|
| Applied to        | Full galaxy $g_{\text{total}}$ sum | Pure resonance $a_{\text{res}}$ sum |
| System            | Cosmic deep field $z=3.5$          | Universal resonance module          |
| $B_{\text{crit}}$ | 1011 T                             | 1011 T                              |
| SCm form          | $1 - B/B_{\text{crit}}$            | $1 - B/B_{\text{crit}}$             |

## 6. Keywords

Cooper pair, superconductor frequency, DPM resonance, SC synthesis, Meissner quench, triple-mode coupling, plasmotic vacuum, SC amplification factor, UQFF superconductivity, resonance-channel suppression,  $A_{\text{sc}} = 6.994\text{e}21$ ,  $E_{\text{Cooper}} = 1.488\text{e-}18$  J, parametric vacuum coupling

---

### Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

*Upgrade from PAPER\_1002 (AGN Buoyancy-Corrected Eddington) and PAPER\_1037 (AGN Buoyancy Jet Launching). See also PAPER\_1009-1010 for  $F_{\{U_{Bi_i}\}}$  jet modulation curves and PAPER\_1048 for phonon-corrected  $M$ - $\sigma$  relation.*

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left( 1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: -  $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$  is the classical Eddington luminosity -  $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$  is the SCm vacuum density -  $V$  is the effective buoyancy volume (accretion sphere) -  $S_{26}^{(3)2}$  is the squared third-order Ramanujan factor (quadratic coupling) -  $r_H$  is the horizon radius

**Jet modulation:** The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[ 1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left( \frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where  $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$  modulates jet power at the phonon frequency.

**$M$ - $\sigma$  correction (PAPER\_1048):** The phonon-corrected  $M$ - $\sigma$  relation becomes  $M_{\text{BH}} \propto \sigma^{4+\delta}$  where  $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$ .

## §A. Cosmogenesis-Linked Lagrangian (PAPER\_877 Symbolic Export)

### §A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

## §A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER\_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where  $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$  inherits the ACP 6-stage evolution (PAPER\_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

## §A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

## §A.4 Cosmogenesis Linkage Chain

$$\text{PAPER\_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U\_Bi\_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U\_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

## §B. VDS/DVP/BSH Deep Synthesis

### §B.1 Vacuum Density Series (VDS)

The canonical VDS ratio  $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$  governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.080 (near-threshold regime), placing it in the  $t \rightarrow \pi$  collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER\_877 cosmogenesis Stage 1 vacuum density initialization:  $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$ .

### §B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 71, \quad n_{\text{channel}} = 4/26$$

Since  $p_{\text{DVP}} = 71$  is **resonant** (threshold at  $p > 26$ ), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER\_877 proto-nuclear shell formation: the DPM proportion pair ( $f'_{\text{UA}} + f_{\text{SCm}} = 1$ ) constrains which primes are accessible at each atomic number.

### §B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U\_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER\_877 Stage 5 buoyancy seed  $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$  which initializes the harmonic series at cosmogenesis.

### §B.4 Production-Scale Consistency

| Proton decay rate                | $\kappa = 0.0005/\text{day}$<br>$\rightarrow \Gamma_p$ suppression                               | $< 4.17 \times 10^{-35}/\text{yr}$ | Super-K 2024                        | PASS<br>Consistent |
| UQFF buoyancy signature          | $F_{\{U\_Bi\_i\}}$ unique gravitational correction                                               | Not yet measured                   | Future gravitational wave detectors | Testable           |

---

**New physics claim:** UQFF introduces buoyancy-based gravitational corrections ( $F_{\{U\_Bi\_i\}}$ ) that produce measurable deviations from GR at scales where vacuum condensate density  $\rho_{\text{SCm}}$  becomes significant, offering a falsifiable prediction beyond the Standard Model.

*Cross-validated with PAPER\_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.*
