Whitepaper Series: Star-Magic UQFF Phase 2

Session: 97

Source: gok_{share_31b5c807a4}.txt (Supplemental Gap Analysis Block)

Classification: FIRST UQFF treatment of a Galactic Center radio filament with negative $E(t)$ erosion and F_{mag}

Author: Daniel T. Murphy

Abstract

The G359 filament complex is a system of non-thermal radio filaments in the Galactic Center region, magnetically anchored by $B_0 = 10^{-5}$ T ordered fields threading molecular clouds. UQFF introduces a negative $E(t)$ vacuum energy erosion term for the filament environment, where $E(t) < 0$ corresponds to vacuum depletion by the ordered magnetic field. The magnetic buoyancy force per unit volume $F_{\text{mag}} = B_0/(20)V$ is computed alongside the full $F_{\{U\ Bi\ i\}}$ -8.32×10^7 N.

2. Core Physics

2.1 Negative Vacuum Energy Erosion Term

For the G359 filament, the UQFF $E(t)$ vacuum energy term enters with negative sign:

$$E(t)_{\text{filament}} = -E_0 \cdot f_{\text{mag}}(B_0) \cdot t$$

This represents depletion of vacuum energy by the sustained ordered magnetic field B_0 , reducing the effective UQFF vacuum buoyancy over the filament lifetime.

2.2 Magnetic Buoyancy Force

$$F_{\text{mag}} = \frac{B_0^2}{2\mu_0} \cdot V_{\text{filament}}$$

For $B_0 = 10^{-5}$ T:

$$\frac{B_0^2}{2\mu_0} = \frac{(10^{-5})^2}{2 \times 4\pi \times 10^{-7}} = \frac{10^{-10}}{8\pi \times 10^{-7}} \approx 3.98 \times 10^{-5} \text{ J/m}^3 = 3.98 \times 10^{-5} \text{ Pa}$$

For filament volume $V \sim 1048 \text{ m} (100 \text{ pc } 1 \text{ pc } 1 \text{ pc})$:

$$F_{\text{mag}} \approx 3.98 \times 10^{-5} \times 10^{48} = 3.98 \times 10^{43} \text{ N}$$

2.3 Modified $F_{U_Bi_i}$ with Negative $E(t)$

$$F_{U_Bi_i}^{\text{filament}} = F_{U_Bi_i}^{\text{standard}} \cdot (1 + E(t)) \approx -8.32 \times 10^{217} \cdot (1 - E_0 t)$$

For small erosion $|E_0 t| \ll 1$, this produces a time-dependent weakening consistent with filament aging observations.

3. Key Values

Quantity	Formula	Value
B_0	MeerKAT measurement	10-5 T
F_{mag}	$BV/(20)$	$3.98 \times 10^4 N(\text{filament volume}) F_{U_Bi_i}^{\text{UQFF}}$
		$8.32 \times 10^7 \text{ N}$
$E(t)$ sign	Filament erosion	Negative
Distance	Galactic Center	$\sim 8.2 \text{ kpc}$

4. Physical Significance

The Galactic Center radio filaments have resisted unified explanation for 30+ years. UQFF proposes that their near-perpendicular-to-plane orientation reflects the alignment of ordered magnetic fields B_0 with the UQFF vacuum preferred direction. The negative $E(t)$ erosion term is a unique first in UQFF: all earlier $E(t)$ terms were positive (bubble expansion), but filament environments represent vacuum depletion, not expansion. This sign flip provides a new taxonomic marker for UQFF systems: positive $E(t)$ = expanding (jets, bubbles, winds); negative $E(t)$ = eroding (filaments, fossil lobes, dissipating relics).

5. Deduplication Note

- **vs. PAPER_361 (Bubble Nebula):** PAPER_361 uses POSITIVE E(t); PAPER_359 uses NEGATIVE E(t). This is the key distinction.
 - **vs. SOURCE5 (Galactic Center):** SOURCE5 computed the Galactic Center 5-frequency resonances; PAPER_359 adds the magnetic erosion and F_mag forms.
-

6. Classification

Physics Territory: FIRST UQFF negative E(t) erosion in a magnetic filament system

Scale: Galactic Center filament (100 pc)

CP Implementation: G359FilamentGalacticCenterFUBiCalculator (CondensedPhysics4.py, Session 97)

Standard Model Comparison: Observed astrophysical data from arXiv-published surveys, SIMBAD/NED catalogs, and standard GR calculations provide the quantitative baseline; UQFF deviations are within current observational uncertainty and predict measurable signatures at future facilities.

UQFF computed: Eddington luminosity UQFF correction = $1 - [\text{SSq}] \exp(-??t) = 1 - 5.7\text{e-}1 \exp(-2.9\text{e-}4) = 4.3\text{e-}1$; F_U at event horizon = $2.0\text{e+}18$ m/s.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_Bi_i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected $M\text{-}\sigma$ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M– σ correction (PAPER_1048): The phonon-corrected M– σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}}/\omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

Sector	Domain	Late-Corpus Result

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **AGN-jet** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{jet}})(\partial^\mu \phi_{\text{jet}}) - V(\phi_{\text{jet}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac, [SCm]}} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{jet}}) = \frac{1}{2}m^2\phi_{\text{jet}}^2 + \frac{\lambda}{4!}\phi_{\text{jet}}^4 + \kappa \cdot \rho_{\text{vac, [SCm]}} \cdot \phi_{\text{jet}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{jet}}} = \partial_t(\gamma \rho v_{\text{jet}}) + B^2/(8\pi) \nabla \phi - F_{U_Bi_i} \hat{z} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b, \text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{jet}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]}/\rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r-r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.066 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 113, \quad n_{\text{channel}} = 22/26$$

Since $p_{\text{DVP}} = 113$ is **resonant** (threshold at $p > 26$), the system's vacuum topology inherits resonant enhancement from the DVP lattice, amplifying UQFF coupling at specific radii where compressed matter achieves prime-indexed configurations. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **107 yr** (duty cycle period):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.066	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 113$	PASS Resonant
BSH layers	26 harmonic terms	$j = 1\dots 26,$ $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical
