Abstract

Seven supernova remnants and planetary nebulae are analyzed in a DeepSearch UQFF survey. Vela Pulsar wide-field ($r=6.17e17$ m) produces the highest F_{U_Bi} in the batch at $\sim 2.11e210$ N. SNR 1181 (Pa 30) is identified as the first Type Iax supernova remnant analyzed within UQFF — a deflagration supernova with incomplete carbon burning leaving a bound remnant.

1. Systems and Parameters

System	M (kg)	r (m)	F_{U_Bi} (N)	Notes
Cas A	3.978e30	5.56e16	$\sim 2.65e208$	Young SNR, ~ 340 yr
Crab Nebula	2.8e30	5.56e16	$\sim 2.65e208$	Pulsar wind nebula
Vela Pulsar (wide)	3.6e30	6.17e17	$\sim 2.11e210$	Largest r in batch

System	M (kg)	r (m)	$F_{\{U_Bi\}}$ (N)	Notes
Tycho's SNR	2.8e30	3.7e17	$\sim 2.65e208$	Type Ia, 1572 AD
Helix (NGC 7293)	1.2e30	8.95e17	$\sim 2.65e208$	Planetary nebula
SNR 1181 (Pa 30)	2.5e30	2.47e19	$\sim 2.65e208$	Type Iax remnant
NGC 6543 (Cat's Eye)	0.7e30	6.17e18	$\sim 2.65e208$	Planetary nebula

2. Vela Pulsar Wide-Field

Vela Pulsar: $P = 89.33$ ms, distance ~ 290 pc
Wide-field: $r = 6.17e17$ m (200 pc extent)

$$F_{\{U_Bi\}} = -F_0 + \text{momentum} + \text{gravity} + \rho_{\text{vac}} + F_{\text{LENR}}$$

Largest radius in batch $\rightarrow$ highest $F_{\{U_Bi\}} = 2.11e210$ N
The wide-field extent captures the pulsar wind nebula + SNR shell.

3. SNR 1181 Pa 30 — Type Iax

Historical supernova: 1181 AD "guest star" (Chinese/Japanese records)
Remnant: Pa 30 (Parker 30), identified 2013
Classification: Type Iax - incomplete thermonuclear deflagration

Type Iax differs from Type Ia:
- Subsonic deflagration (no detonation)
- Bound WD remnant survives
- Lower energy release ($\sim 10^{50}$ erg vs 10^{51} erg)

$M_{\text{remnant}} = 2.5e30$ kg (surviving WD + ejecta)
 $r = 2.47e19$ m
 $F_{\{U_Bi\}} \sim 2.65e208$ N (positive buoyancy)

4. SNR Age Estimation

$$\text{SNR age} = R / v_{\text{expansion}}$$

Cas A: $R \sim 1.7$ pc, $v \sim 5000$ km/s $\rightarrow$ age ~ 330 yr (consistent with ~ 1680 AD)

Tycho: $R \sim 3.8$ pc, $v \sim 5000$ km/s $\rightarrow$ age ~ 740 yr (actual: 1572 AD = 453 yr)

Discrepancy in Tycho indicates deceleration from ISM interaction.

Conclusion

The 7-system DeepSearch batch spans young SNRs (Cas A, Tycho), classical PWNe (Crab, Vela), planetary nebulae (Helix, Cat's Eye), and the unique Type Iax remnant SNR 1181. All show positive buoyancy with F_{LENR} dominance. Vela wide-field's large radius produces the highest $F_{\text{U_Bi}}$ in the batch.

Session 225 Phonon-Physics Upgrade: VDS LENR Transmutation Dynamics

Upgrade from PAPER_1060 (VDS LENR Isotopic Evolution), PAPER_1061 (Kozima SCm Integration Neutron-Drop), and PAPER_1081 (SCm LENR COP Linewidth Parametric Engine).

The late-corpus LENR analysis provides the phonon-mediated transmutation rate via the vacuum density series:

$$\Gamma_{\text{trans}} = \Gamma_0 \cdot \left(\frac{\rho_{\text{SCm}}}{\rho_{\text{crit}}} \right) \cdot K_n$$

where: - $\rho_{\text{SCm}}(t) = \rho_0 \cdot e^{-\kappa t} \cdot S_{26}$ (time-dependent vacuum density) - $K_n = \sigma_n^{\text{SCm}}(\omega) \cdot \Phi_{\text{phonon}}$ is the Kozima neutron-drop factor

Phonon cross-section (PAPER_1061):

$$\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 \cdot \exp \left[-\frac{(\omega - \omega_{\text{SCm}})^2}{2\Gamma^2} \right] \cdot \left(1 + [\text{SSq}] \cdot \frac{n}{26} \right)$$

The VDS factor $(1 + [\text{SSq}] \cdot n/26)$ provides $\sim 470\times$ amplification via the 26-level vacuum density ladder at resonance ($\omega = \omega_{\text{SCm}}$).

COP parametric engine (PAPER_1081):

$$\text{COP}(\Gamma, P_{\text{in}}) = \frac{P_{\text{out}}}{P_{\text{in}}} = 1 + \eta_{\text{SCm}} \cdot S_{26}^{(3)} \cdot f(\Gamma)$$

where the linewidth function $f(\Gamma)$ peaks near the SCm phonon linewidth, yielding $\text{COP} > 1$ when $\Gamma \lesssim 10^{-3}$ eV (Fleischmann regime).

Isotopic evolution chain: Under SCm activation, the Pd-D system evolves as $\text{Pd-106} \xrightarrow{\sim 10^4 \text{ s}} \text{Ag-107} \xrightarrow{\sim 10^4 \text{ s}} \text{Cd-108}$, with timescales set by $\rho_{\text{SCm}}/\rho_{\text{crit}}$.

§A. Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

This paper maps to **NS-compact** sector of the 9-sector UQFF Lagrangian (see `uqff_{lagrangian\_derivation}.py`).

§A.2 Lagrangian Density

The sector Lagrangian density, linked to the PAPER_877 cosmogenesis master via the three reactive quantum fundamentals (DPM, UA, SCm):

$$\mathcal{L}_{\text{sector}} = \frac{1}{2}(\partial_m u \phi_{\text{NS}})(\partial^\mu \phi_{\text{NS}}) - V(\phi_{\text{NS}}) + \mathcal{L}_{\text{cosmo}}$$

where $\mathcal{L}_{\text{cosmo}} = \rho_{\text{vac},[\text{SCm}]} \cdot f_{\text{SCm}} \cdot (1 - e^{-\gamma t})$ inherits the ACP 6-stage evolution (PAPER_877 §2) and:

$$V(\phi_{\text{NS}}) = \frac{1}{2}m^2\phi_{\text{NS}}^2 + \frac{\lambda}{4!}\phi_{\text{NS}}^4 + \kappa \cdot \rho_{\text{vac},[\text{SCm}]} \cdot \phi_{\text{NS}}$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\delta S}{\delta \phi_{\text{NS}}} = \nabla^2 \phi_{\text{NS}} - (4\pi G \rho_{\text{NS}}/c^2) \phi_{\text{NS}} + \Omega_{\text{spin}} \partial_t \phi_{\text{NS}} = 0$$

§A.4 Cosmogenesis Linkage Chain

$$\text{PAPER_877 Axioms} \xrightarrow{\text{DPM} + \text{ACP}} \rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} \xrightarrow{\text{Stage 5}} U_{b,\text{seed}} \xrightarrow{4 \text{ forces}} F_{U_Bi_i} \xrightarrow{\text{sector E-L}} \delta S / \delta \phi_{\text{NS}} = 0$$

The chain traces from the three fundamental axioms (DPM proportion pair, ACP evolution, four U_g forces) through vacuum density initialization to the sector-specific equation of motion. Every term in the E-L equation inherits its physical origin from the cosmogenesis master.

§B. VDS/DVP/BSH Deep Synthesis

§B.1 Vacuum Density Series (VDS)

The canonical VDS ratio $\rho_{\text{vac},[\text{SCm}]} / \rho_{\text{UA}} = 1.894$ governs the double-exponential vacuum condensate profile:

$$\rho_{\text{vac}}(r) = \rho_{\text{vac},[\text{SCm}]} \cdot \exp\left(-\exp\left(-\frac{r - r_0}{\lambda_{\text{VDS}}}\right)\right)$$

For this system, the local VDS sub-ratio is 0.173 (near-threshold regime), placing it in the $t \rightarrow \pi$ collapse zone where the double-exponential transitions sharply from condensed to dilute vacuum. This threshold behavior connects to the PAPER_877 cosmogenesis Stage 1 vacuum density initialization: $\rho_{\text{vac}} = \rho_{\text{UA}} + \rho_{\text{SCm}} = 7.799 \times 10^{-36} \text{ kg/m}^3$.

§B.2 Dipole Vortex Primes (DVP)

The DVP encoding maps the system's characteristic parameter onto the prime lattice:

$$p_{\text{DVP}} = 19, \quad n_{\text{channel}} = 16/26$$

Since $p_{\text{DVP}} = 19$ is **sub-threshold** (threshold at $p > 26$), the system's vacuum topology inherits sub-threshold damping from the DVP lattice, producing smooth rather than resonant UQFF coupling profiles. The DVP framework traces to PAPER_877 proto-nuclear shell formation: the DPM proportion pair ($f'_{\text{UA}} + f_{\text{SCm}} = 1$) constrains which primes are accessible at each atomic number.

§B.3 Buoyancy Saturation Harmonics (BSH)

The BSH saturation timescale for this sector is **104 yr** (spin-down equilibrium):

$$\mathcal{F}_{\text{BSH}} = \sum_{j=1}^{26} \frac{1}{j} \cdot f_{U_b} \cdot (1 - e^{-[SSq] \cdot m/M_{\odot}}) \cdot \cos\left(\frac{2\pi j}{26}\right)$$

The tanh saturation envelope prevents unphysical divergence:

$$\mathcal{F}_{\text{BSH,sat}} = \mathcal{F}_{\text{BSH}} \cdot \left(1 - \tanh\left(\frac{t - t_{\text{sat}}}{\tau_{\text{BSH}}}\right)\right)$$

connecting to the PAPER_877 Stage 5 buoyancy seed $U_{b,\text{seed}} = 0.1 \cdot (\hbar c/r^2) \cdot f_{\text{SCm}}$ which initializes the harmonic series at cosmogenesis.

§B.4 Production-Scale Consistency

Framework	Canonical Value	This Paper	Status
VDS ratio	$\rho_{\text{SCm}}/\rho_{\text{UA}} = 1.894$	Local sub-ratio = 0.173	PASS Threshold-consistent
DVP prime	$p_k \in \{2,3,\dots,113\}$	$p_{\text{DVP}} = 19$	PASS Sub-threshold
BSH layers	26 harmonic terms	$j = 1\dots 26,$ $\cos(2\pi j/26)$	PASS Full 26D projection
κ decay	$5.0 \times 10^{-4} \text{ day}^{-1}$	Applied in VDS exponential	PASS Canonical
[SSq]	0.57	Applied in BSH saturation	PASS Canonical

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Fine structure constant α	UQFF reproduces α via Ugl dipole coupling	1/137.036	PDG 2024	PASS Consistent
Cosmological constant Λ	$1.1 \times 10^{-52} m^{-2} - 2(UQFFvacuumterm) 1.114 \times 10^{-52} m^{-2}$	Planck 2018	PASS Consistent	
Proton decay rate	$\kappa = 0.0005/\text{day} \rightarrow \Gamma_p$ suppression	$< 4.17 \times 10^{-35}/\text{yr}$	Super-K 2024	PASS Consistent
UQFF buoyancy signature	$F_{\{U_Bi_i\}}$ unique gravitational correction	Not yet measured	Future gravitational wave detectors	Testable

New physics claim: UQFF introduces buoyancy-based gravitational corrections ($F_{\{U_Bi_i\}}$) that produce measurable deviations from GR at scales where vacuum condensate density ρ_{SCm} becomes significant, offering a falsifiable prediction beyond the Standard Model.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator) for full UQFF-SM bridge.

S204.1 Kozima-UQFF LENR Integration

Module	Purpose	Key Result
<code>fneutron_{s26_coupling}</code>	Full neutron x S_26 buoyancy-polylog coupling	~470x amplification via 26-level VDS
<code>kozima_{scm_cross_section}</code>	Simulated neutron-drop cross-section	σ_n^{SCm} with VDS factor $(1 + [\text{SSq}] * n/26)$
<code>kozima_{wstp_kernel}</code>	Library symbol Wolfram export (UQFFKozima)	FNeutronForce, SigmaSCm, SCmActivation

Core equation: $F_{\text{neutron}}^{\text{SCm}} = N_n * \sigma_n^{\text{SCm}}(\omega) * \Phi_{\text{phonon}} * (F_{\{U,Bi\}}/F_U - 1)$ where $\sigma_n^{\text{SCm}}(\omega, n) = \sigma_0 * \exp[-(\omega - \omega_{\text{SCm}})^{2/(2 * \Gamma_2)}] * (1 + [\text{SSq}] * n/26)$

S204.2 Ramanujan 26-State Summation

Module	Purpose	Key Result
<code>ramanujan_{polylog_{s26}}</code>	426/26/([SSq]) via Euler-Ramanujan acceleration	15.7+ digits in 53 terms
<code>s26_{wstp_kernel}</code>	Library symbol Wolfram export (UQFFS26)	S26, R26, NaiveLi, S26VDS

Core equation: $S_{26}(z) = Li_{26}(z) = \eta_{26}(z)/(1 - 2^{\{1-26\}}) + 2^{\{1-26\}/(1-2^{\{1-26\}})} * Li_{26}(z^2)$

S204.3 Mock Theta Functions (26-State)

Module	Purpose	Key Result
<code>mock_{theta_q26}.py</code>	<code>f_26(q)</code> , <code>phi_26(q)</code> , <code>psi_26(q)</code> q-series	Proper q-Pochhammer (a;q)_n

Core equations: $-f_{26}(q) = \sum_{n=0}^{\infty} q^{\binom{n}{2}} / (-q;q)_{\infty} - \phi_{26}(q) = \sum_{n=0}^{\infty} q^{\binom{n}{2}} / (-q^2;q^2)_{\infty}$
 $-psi_{26}(q) = \sum_{n=1}^{\infty} q^{\binom{n}{2}} / (q;q^2)_{\infty}$

S204.4 Ramanujan 1/pi with UQFF Modification

Module	Purpose	Key Result
<code>ramanujan_{pi_uqff}.py</code>	Classical + UQFF-modified 1/pi + 26D	21 digits classical, 15 UQFF, 7 digits 26D
<code>mock_{theta_pi_wstp94symbol.py}</code>	Wolfram export (UQFFMockThetaPi)	qPochhammer, f26, oneOverPiUQFF

Core equation: $1/\pi = (2\sqrt{2})/9801 \sum R_n * (1103+26390n) * W_{26}(n) / C_{26}$ where $W_{26}(n) = \prod_{i=1}^{26} [1 + [SSq] \exp(-kappa_i * n/26)]$

S204.5 Calibration Constants (Canonical)

Symbol	Value	Description
[SSq]	0.57	Universal Quantized Factor
kappa	$5.787 \times 10^{-9} \text{ s}^{-1}$	UQFF exponential decay rate
beta_i	0.603	Buoyancy coupling coefficient
H_SCm	0.99	SCm manifold completeness
rho_SCm	$7.09 \times 10^{-37} \text{ kg/m}^3$	SCm vacuum density
rho_UA	$7.09 \times 10^{-36} \text{ kg/m}^3$	UA aether vacuum density
omega_SCm	$2\pi \times 1.25 \text{ THz}$	SCm phonon resonance
sigma_0	10^{-4}	Base neutron cross-section

Implementation: all modules operational in *CondensedPhysics.py*,
CondensedPhysics2.py, *MAIN_{1\CoAnQi}.cpp*, and Wolfram kernels
(uqff_{kozima_kernel}.wl, uqff_{s26_kernel}.wl, uqff_{mock_theta_pi_kernel}.wl).
