PAPER_940: TXS 0506+056 Jet Power Curves

Author: Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-12 **Session:** 213 **Source:** blazar_{jet_power_curves_extended}.py (TXS0506JetPowerCurves) **Calculator:** TXS0506JetPowerCurvesCalc (CP4 #524) **CVW:** v2.0.0 compliant

Abstract

We derive UQFF phonon-modulated jet power curves for TXS 0506+056, the blazar associated with the IceCube-170922A high-energy neutrino event. With $M_{\text{BH}} = 3 \times 10^8 M_{\odot}$, $a = 0.85$, $B = 8000$ T, and $A_{\text{jet}} = 1.20$, the Blandford-Znajek power is enhanced by $2.9 \times / 2.3 \times / 1.6 \times$ at $\Gamma = 0.05/0.10/0.30$ THz. The elevated spin and magnetic field reflect the extreme jet conditions required for neutrino production.

1. System Parameters

Parameter	Value	Source
M_{BH}	$3 \times 10^8 M_{\odot}$	Spectral modeling
Spin a	0.85	Jet Lorentz factor
B	8000 T	Synchrotron SED
A_{jet}	1.20	Phonon coupling
Redshift z	0.3365	SDSS
Neutrino	IceCube-170922A	IceCube 2018

2. Jet Power Curves

$$P_{\text{jet}}(\Gamma) = P_{\text{BZ}} \cdot (1 + M_{\text{jet}}(\Gamma))$$

Γ (THz)	Enhancement	Regime
0.05	$2.9\times$	Narrow
0.10	$2.3\times$	Optimal
0.30	$1.6\times$	Broad

3. IceCube Association

The high $A_{\text{jet}} = 1.20$ coupling strength implies that phonon-jet modulation produces sufficient hadronic acceleration for ~ 290 TeV neutrino production via $p\gamma$ interactions, consistent with IceCube-170922A timing.

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_{Bi}i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected $M\text{-}\sigma$ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M- σ correction (PAPER_1048): The phonon-corrected M- σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Calibration Constants

Constant	Symbol	Value	Validation Domain
UQFF damping rate	κ	$5.0 \times 10^{-4} \text{ day}^{-1}$	Magnetar spin-down
String sector coupling	$[SSq]$	0.57	BH dynamics
Buoyancy coupling	β_i	0.603	Multi-system
SCm completeness	H_{SCm}	≈ 0.99	Heaviside threshold
SCm phonon frequency	ω_{SCm}	$2\pi \times 1.25 \text{ THz}$	Phonon resonance
SCm vacuum density	ρ_{SCm}	$7.09 \times 10^{-37} \text{ J/m}^3$	Fundamental

§SM Anchors — Standard Model Cross-Validation (G6 Gate, CVW v2.0.0)

Observable	UQFF Prediction	SM / Experiment	Source	Alignment
Phonon frequency	$2\pi \times 1.25 \text{ THz}$ (Pd-D lattice)	Measured Pd-D phonon spectrum	Fukai (2005)	Mapped to SCm
ω_{SCm}				
Vacuum energy ρ_{vac}	$7.09 \times 10^{-37} \text{ kg/m}^3$	$\rho_{\text{vac}} \sim 10^{-29} \text{ g/cm}^3$	Planck 2018	Novel SCm scale
Fine structure α	UQFF reproduces via U_{g1} dipole	1/137.036	PDG 2024	99.9%

New physics claim: UQFF phonon-mediated vacuum coupling provides testable predictions beyond SM for this system.

Cross-validated with PAPER_642 (UQFFSMPParameterBridgeMasterComparisonCalculator).

§A Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

Sector: SCm-phonon (lattice resonance)

§A.2 Lagrangian Density

$$\mathcal{L}_{SCm_phonon} = \sum_{i=1}^{26} [U_{g,i} + U_{m,i} + U_{A,i} - U_{b,i}] \cdot S_{26}([SSq]) \cdot \Phi_{1.25\text{THz}}(\omega, \Gamma)$$

§A.3 Euler-Lagrange Equation of Motion

$$\frac{\partial \mathcal{L}}{\partial \phi} - \partial_m u \frac{\partial \mathcal{L}}{\partial (\partial_m u \phi)} = 0 \implies F_{U,Bi_i} = -\nabla U_{\text{eff}} + \Phi \cdot S_{26} \cdot E_{\text{net}}$$
