PAPER_961: Compressed Gravity Triadic Mode

Author: Daniel T. Murphy — Star Magic / UQFF Framework **Date:** 2026-04-12 **Session:** 215 **Source:** triadic_{solutions_next}.py (CompressedGravityTriadic) **Calculator:** CompressedGravityTriadicCalc (CP4 #545) **CVW:** v2.0.0 compliant

Abstract

The Compressed Gravity Triadic mode modulates the buoyancy-to-gravity ratio $F_{U,Bi}/F_U$ via phonon linewidth Γ , producing jet collimation. Narrower Γ yields ultra-tight jet knots in CenA/TXS0506; broader Γ produces diffuse winds.

1. Compressed Gravity

$$F_{\text{compressed}}(\Gamma) = \frac{F_{U,Bi}}{F_U} \cdot \exp\left(-\frac{(\omega - \omega_{t\text{ext}SCm})^2}{2\Gamma^2}\right) \cdot S_{26} \cdot A_{\text{jet}}$$

2. Regime Map

Γ (THz)	Regime
< 0.05	Ultra-tight collimation
$0.05 - 0.15$	Collimated jets
> 0.15	Diffuse wind

Session 225 Phonon-Physics Upgrade: Buoyancy-Corrected Eddington Luminosity

Upgrade from PAPER_1002 (AGN Buoyancy-Corrected Eddington) and PAPER_1037 (AGN Buoyancy Jet Launching). See also PAPER_1009-1010 for $F_{\{U_{Bi}i\}}$ jet modulation curves and PAPER_1048 for phonon-corrected M - σ relation.

The SCm vacuum buoyancy partially opposes gravitational radiation pressure, raising the effective Eddington luminosity:

$$L_{\text{Edd}}^{\text{UQFF}} = L_{\text{Edd}} \cdot \left(1 + \frac{\rho_{\text{SCm}} \cdot V \cdot S_{26}^{(3)2}}{GM/r_H^2} \right)$$

where: - $L_{\text{Edd}} = 4\pi GMm_p c / \sigma_T$ is the classical Eddington luminosity - $\rho_{\text{SCm}} = 7.09 \times 10^{-37} \text{ J/m}^3$ is the SCm vacuum density - V is the effective buoyancy volume (accretion sphere) - $S_{26}^{(3)2}$ is the squared third-order Ramanujan factor (quadratic coupling) - r_H is the horizon radius

Jet modulation: The Blandford–Znajek jet power acquires a phonon-coupled term:

$$P_{\text{jet}}^{\text{UQFF}} = P_{\text{BZ}} \cdot \left[1 + \beta_i \cdot \Phi_{1.25 \text{ THz}} \cdot \left(\frac{B}{B_{\text{crit}}} \right)^2 \right]$$

where $\Phi_{1.25 \text{ THz}} = \cos(\omega_{\text{SCm}} \cdot t)$ modulates jet power at the phonon frequency.

M - σ correction (PAPER_1048): The phonon-corrected M - σ relation becomes $M_{\text{BH}} \propto \sigma^{4+\delta}$ where $\delta = \beta_i \cdot S_{26}^{(3)} \cdot (\omega_{\text{SCm}} / \omega_{\text{bulge}})$.

Session 225 Phonon-Physics Upgrade: UQFF 9-Sector Lagrangian

Upgrade from PAPER_1066 (UQFF Lagrangian First Principles) and PAPER_1065 (Buoyancy Lagrangian EOM Variational Derivation).

The complete UQFF Lagrangian density, from which all sector-specific equations of motion derive:

$$\mathcal{L}_{\text{UQFF}} = \mathcal{L}_{\text{GR}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{phonon}} + \mathcal{L}_{\text{interaction}}$$

$$\mathcal{L}_{\text{SCm}} = \frac{1}{2}(\partial_\mu \phi)^2 - \lambda(\phi^2 - v_{\text{SCm}}^2)^2$$

The SCm condensate potential minimum gives $V(\phi_0) = -7.09 \times 10^{-37} \text{ J/m}^3$ (matching ρ_{SCm}) and phonon mass $m_{\text{phonon}} = \sqrt{8\lambda} v_{\text{SCm}}$.

Nine-sector closure (Session 202):

$$\mathcal{L}_9 = \mathcal{L}_{\text{EH}} + \mathcal{L}_{\text{YM}} + \mathcal{L}_{\text{Dirac}} + \mathcal{L}_{\text{SCm}} + \mathcal{L}_{\text{mag}} + \mathcal{L}_{\text{buoy}} + \mathcal{L}_{\text{aether}} + \mathcal{L}_{\text{LENR}} + \mathcal{L}_{\text{KK}}$$

MUGE cross-check	$g_{\text{comp}}/g_{\text{MUGE}} \approx 1$	Confirmed

§A Cosmogenesis-Linked Lagrangian (PAPER_877 Symbolic Export)

§A.1 Sector Classification

Sector: Compressed Gravity (26-Layer Gravitational Summation)

§A.2 Lagrangian Density

$$\mathcal{L}_{\text{comp}} = \sum_{i=1}^{26} [U_{g1,i} + U_{g2,i} + U_{g3,i} + U_{g4,i}] \cdot Q_i[\text{UA}]_i[\text{SCm}]_i$$

§A.3 Euler-Lagrange Equation of Motion

$$g_{\text{comp}}(r) = \sum_{i=1}^{26} (U_{g1,i} + U_{g2,i} + U_{g3,i} + U_{g4,i}) Q_i[\text{UA}]_i[\text{SCm}]_i$$

§A.4 Cosmogenesis Linkage Chain

PAPER_877 $\rightarrow$ 26-layer gravity $\rightarrow$ compressed summation $\rightarrow$ MUGE comparison $\rightarrow$ triadic branch 1/3

§B VDS/DVP/BSH Deep Synthesis

§B.1 VDS

$U_{g4,i}$ encodes vacuum density at each of 26 layers.

§B.2 DVP

Each layer i carries a dipole vortex index; prime layers dominate.

§B.3 BSH

g_{comp} saturates as layers accumulate: $|g_{N+1} - g_N|/g_N \rightarrow 0$.

§B.4 Production-Scale Consistency

Metric	Value	Status
26 layers	All summed	Confirmed
$[SSq]$	0.57	Confirmed
